Schematic operators

Schematic operators

PDDL

Overview

Domain files

Problem files

Example
Schematic operators

- Description of state variables and operators in terms of a given finite set of objects.
- Analogy: propositional logic vs. predicate logic
- Planners take input as schematic operators and translate them into (ground) operators. This is called *grounding*. 
Schematic operators: example

Schematic operator

\[ x \in \{\text{car1, car2}\} \]
\[ y_1 \in \{\text{Freiburg, Strasbourg}\}, \]
\[ y_2 \in \{\text{Freiburg, Strasbourg}\}, y_1 \neq y_2 \]
\[ \langle in(x, y_1), in(x, y_2) \land \neg in(x, y_1) \rangle \]

corresponds to the operators

\[ \langle in(\text{car1, Freiburg}), in(\text{car1, Strasbourg}) \land \neg in(\text{car1, Freiburg}) \rangle, \]
\[ \langle in(\text{car1, Strasbourg}), in(\text{car1, Freiburg}) \land \neg in(\text{car1, Strasbourg}) \rangle, \]
\[ \langle in(\text{car2, Freiburg}), in(\text{car2, Strasbourg}) \land \neg in(\text{car2, Freiburg}) \rangle, \]
\[ \langle in(\text{car2, Strasbourg}), in(\text{car2, Freiburg}) \land \neg in(\text{car2, Strasbourg}) \rangle \]
Schematic operators: quantification

Existential quantification (for formulae only)
Finite disjunctions $\phi(a_1) \lor \cdots \lor \phi(a_n)$ represented as
$\exists x \in \{a_1, \ldots, a_n\} : \phi(x)$.

Universal quantification (for formulae and effects)
Finite conjunctions $\phi(a_1) \land \cdots \land \phi(a_n)$ represented as
$\forall x \in \{a_1, \ldots, a_n\} : \phi(x)$.

Example
$\exists x \in \{A, B, C\} : \text{in}(x, \text{Freiburg})$ is a short-hand for
$\text{in}(A, \text{Freiburg}) \lor \text{in}(B, \text{Freiburg}) \lor \text{in}(C, \text{Freiburg})$. 
PDDL: the Planning Domain Definition Language

- used by almost all implemented systems for deterministic planning
- supports a language comparable to what we have defined above (including schematic operators and quantification)
- syntax inspired by the Lisp programming language: e.g. prefix notation for formulae

\[
\text{(and (or (on A B) (on A C))}
\]
\[
\text{(or (on B A) (on B C))}
\]
\[
\text{(or (on C A) (on A B)))}
\]
PDDL: domain files

A domain file consists of

- `(define (domain DOMAINNAME)`
- a :requirements definition (use :adl :typing by default)
- definitions of types (each parameter has a type)
- definitions of predicates
- definitions of operators
Example: blocks world in PDDL

(define (domain BLOCKS)
  (:requirements :adl :typing)
  (:types block - object
    blueblock smallblock - block)
  (:predicates (on ?x - smallblock ?y - block)
    (ontable ?x - block)
    (clear ?x - block)
  )
PDDL: operator definition

- (:action OPERATORNAME)
- list of parameters: (?x - type1 ?y - type2 ?z - type3)
- precondition: a formula

  <schematic-state-var>
  (and <formula> ... <formula>)
  (or <formula> ... <formula>)
  (not <formula>)
  (forall (?x1 - type1 ... ?xn - typen) <formula>)
  (exists (?x1 - type1 ... ?xn - typen) <formula>)
effect:

<schematic-state-var>
(not <schematic-state-var>)
(and <effect> ... <effect>)
(when <formula> <effect>)
(forall (?x1 - type1 ... ?xn - typen) <effect>)
(:action fromtable
  :parameters (?x - smallblock ?y - block)
  :precondition (and (not (= ?x ?y))
                  (clear ?x)
                  (ontable ?x)
                  (clear ?y))
  :effect
  (and (not (ontable ?x))
       (not (clear ?y))
       (on ?x ?y)))
PDDL: problem files

A problem file consists of

- `(define (problem PROBLEMNAME))`
- declaration of which domain is needed for this problem
- definitions of objects belonging to each type
- definition of the initial state (list of state variables initially true)
- definition of goal states (a formula like operator precondition)
(define (problem example)
  (:domain BLOCKS)
  (:objects a b c - smallblock)
      d e - block
      f - blueblock)
  (:init (clear a) (clear b) (clear c)
      (clear d) (clear e) (clear f)
      (ontable a) (ontable b) (ontable c)
      (ontable d) (ontable e) (ontable f))

  (:goal (and (on a d) (on b e) (on c f)))
)
Example run on the FF planner

```bash
# ./ff -o blocks-dom.pddl -f blocks-ex.pddl
ff: parsing domain file, domain 'BLOCKS' defined
ff: parsing problem file, problem 'EXAMPLE' defined
ff: found legal plan as follows
step 0: FROMTABLE A D
    1: FROMTABLE B E
    2: FROMTABLE C F
0.01 seconds total time
```
Example: blocks world in PDDL

(define (domain BLOCKS)
  (:requirements :adl :typing)
  (:types block)
  (:predicates (on ?x - block ?y - block)
    (ontable ?x - block)
    (clear ?x - block))
)
(:action fromtable
  :parameters (?x - block ?y - block)
  :precondition (and (not (= ?x ?y))
                   (clear ?x)
                   (ontable ?x)
                   (clear ?y))
  :effect
    (and (not (ontable ?x))
         (not (clear ?y))
         (on ?x ?y)))
(:action totable
  :parameters (?x - block ?y - block)
  :precondition (and (clear ?x) (on ?x ?y))
  :effect
    (and (not (on ?x ?y))
      (clear ?y)
      (ontable ?x)))
(:action move
 :parameters (?x - block
  ?y - block
  ?z - block)
 :precondition (and (clear ?x) (clear ?z)
  (on ?x ?y) (not (= ?x ?z)))
 :effect
  (and (not (clear ?z))
   (clear ?y)
   (not (on ?x ?y))
   (on ?x ?z)))
(define (problem blocks-10-0)
  (:domain BLOCKS)
  (:objects d a h g b j e i f c - block)
  (:init (clear c) (clear f)
    (ontable i) (ontable f)
    (on c e) (on e j) (on j b) (on b g)
    (on g h) (on h a) (on a d) (on d i))
  (:goal (and (on d c) (on c f) (on f j)
    (on j e) (on e h) (on h b)
    (on b a) (on a g) (on g i))))
)
