Terminological reasoning

January 11, 2013

- Often, we need to use semantic (conceptual, terminological) knowledge ...
- For example, consider a knowledge base that classifies things into different categories, which in turn may be organized in some hierarchical way
 - Task: Query objects that belong to a specific category or one of its super categories . . .
- Even more involved: Anser queries of users of the knowledge base who are not aware of the internal categories of the knowledge base
- Topic of this section: a naïve (maybe too naïve) approach to reasoning with terminological knowledge, namely inheritance networks

Intuition

Definition

A strict inheritance network is defined by a set of nodes (representing concepts, properties) and a set of directed edges (representing generalization, the is-a-relation).

- Reasoning problem: Is some concept C a specialization (a subconcept) of another concept C'?
- and how can we solve this problem efficiently?

Semantics

Logical semantics

■ We assign the following logical semantics to **isa**-formulae:

$$C_1$$
 isa $C_2 \mapsto \forall x. C_1(x) \rightarrow C_2(x)$

- ...i.e., we interpret each directed edge or isa-formula as a universally quantified implication.
- This is intuitively plausible: each instance of a sub-concept is an instance of the super-concept.
- Now we can reduce the inheritance problem as follows: Let $\pi(\Theta)$ be the translation. Then we want to know:

$$\pi(\Theta) \models \forall x. C_1(x) \rightarrow C_2(x)$$
?

A strict inheritance network can be seen as a set Θ of formulae of the form

 C_1 isa C_2 .

Example

Student isa Person Student isa studious

Professor isa Person

Professor isa knowledgeable

Grad-Student isa Student

Undergrad-Student isa Student

Reasoning problem (inheritance problem): $\Theta \models C_1$ isa C_2 ?

8/31 January 11, 2013 Nebel, Wölfl, Hué - KRR

A polynomial reasoning algorithm

Let G_{Θ} be the graph corresponding to Θ . Then we have:

$$\pi(\Theta) \models \forall x. C_1(x) \rightarrow C_2(x)$$

there exists a path in G_{Θ} from C_1 to C_2 .

- ... which has to be proven (next slides).
- Thus, we have reduced reasoning in strict inheritance networks to graph reachability problem, which is solvable in polynomial time.
- Note: Reasoning is not simple because we used a graph to represent the knowledge (there are actually very difficult graph problems),
- ... reasoning is simple because the expressiveness compared with first-order logic is very restricted.

Soundness

BURG

Theorem (Soundness of inheritance reasoning)

If there exists a path from C_1 to C_2 in G_{Θ} , then

$$\pi(\Theta) \models \forall x. C_1(x) \rightarrow C_2(x).$$

Proof.

If there is a path, then there exists a chain of implications of the form $\forall x. D_i(x) \rightarrow D_{i+1}(x)$ with $D_0 = C_1$ and $D_n = C_2$. Since logical implication is transitive, the claim follows trivially.

Theorem (Completeness of inheritance reasoning)

If $\pi(\Theta) \models \forall x. C_1(x) \rightarrow C_2(x)$, then there exists a path from C_1 to C_2 in G_{Θ} .

Proof.

We prove the contraposition. Assume that there exists no such path from C_1 to C_2 in G_{Θ} . We show that $\pi(\Theta) \not\models \forall x. C_1(x) \rightarrow C_2(x)$. For this define an interpretation on a universe with exactly one element

d such that d is in the interpretation of C_1 and in the interpretation of all concepts reachable from C_1 by following directed edges (and not in the interpretation of any other concept).

This interpretation satisfies all formulae in $\pi(\Theta)$.

However, it does not satisfy $\forall x. C_1(x) \rightarrow C_2(x)$.

For this reason, we have $\pi(\Theta) \not\models \forall x. C_1(x) \rightarrow C_2(x)$.

Extension of the semantics

Logical semantics:

i inst-of $C \mapsto C(i)$.

- Problem 1: Is this extension of the language conservative? That is, can we still decide $\Theta \models C_1$ isa C_2 without taking formulae of the form i inst-of C into account?
- yes (but has to be shown)
- Problem 2: Is it true: $\Theta \models i$ **inst-of** C if and only if there is a path from the node i to the node C in G_{Θ} ?
- yes (has to be shown)
- This means, we can also use efficient graph algorithms for this extension.

A further extension: negated concepts

19/31

We now allow for negated concepts, i.e, concept terms of the form

not C.

where C is concept name (an atomic concept).

Example

Undergrad-Student isa not Grad-Student

Logical semantics:

 $\operatorname{\mathsf{not}} C \mapsto \neg C(x)$

Example

 C_1 isa not $C_2 \mapsto \forall x. C_1(x) \rightarrow \neg C_2(x)$.

Complementing an inheritance network

Define $\overline{\alpha}$:

$$\overline{C} = \mathbf{not}\,C$$

 $\overline{\operatorname{not} C} = C$

Construct G_{Θ} from Θ as follows:

- For each concept name *C*, we will have two nodes: *C* and not *C*.
- For each formula α_1 isa α_2 , we introduce the following two edges:

$$lpha_1
ightarrow lpha_2$$

 $\overline{lpha_2}
ightarrow \overline{lpha_1}$

Satisfiability of an inheritance network

22 / 31

INI REIBURG

- Strict inheritance networks without negation are always satisfiable, i.e. they have a non-empty model (which one?)
- This is no longer true when we allow for negated concepts. Consider:

P isa not P. not P isa P

means

$$\forall x. P(x) \rightarrow \neg P(x), \ \forall x. \neg P(x) \rightarrow P(x),$$

which is equivalent to

$$\forall x. \neg P(x), \forall x. P(x).$$

- ... i.e., this set of formulae is not satisfiable, symb. $\Theta \models \bot$.
- This is important to find out since in this case everything follows.

Deciding satisfiability

Theorem (Satisfiability of strict networks with negation)

 $\Theta \models \bot$ if and only if the graph G_{Θ} contains a cycle from α to $\overline{\alpha}$ and back to α .

Proof.

January 11, 2013

 \Leftarrow : Adding $\overline{\alpha_2} \to \overline{\alpha_1}$ corresponds to adding

$$\forall x. \neg \alpha_2(x) \rightarrow \neg \alpha_1(x)$$

when $\forall x.\ \alpha_1(x) \to \alpha_2(x)$ is given. This is logically correct (contraposition). Since all directed paths in G_Θ correspond to universally quantified implications that can be deduced from $\pi(\Theta)$, a cycle as in the theorem implies:

$$\forall x. \, \alpha(x) \rightarrow \overline{\alpha}(x), \ \forall x. \, \overline{\alpha}(x) \rightarrow \alpha(x).$$

This, however, is unsatisfiable.

A simple network

Semantic Networks with

Semantic Networks with Negation

> Satisfiability of a Semantic Network

Semantic Networks with Negation and

Literature

23 / 31

Proof – continued

Proof (cont'd).

 \Rightarrow : We have to show that unsatisfiability of Θ implies the existence of a cycle from some node α to $\overline{\alpha}$ and back to α in G_{Θ} .

We prove the contraposition, i.e. that the absence of any such cycle implies satisfiability.

We start with the universe $\mathbf{D} = \{d\}$ and then construct step-wise an interpretation for all concepts. Convention: When we assign $\alpha^{\mathcal{I}} = \{d\}$, then we assign $\overline{\alpha}^{\mathcal{I}} = \emptyset$ simultaneously.

- 11 Choose an α without an interpretation that has no path to $\overline{\alpha}$.
- 2 Assign $\alpha^{\mathcal{I}} = \{d\}$ and continue to do that for all concepts β reachable from α that do not have an interpretation.
- 3 Continue until all concepts have an interpretation.

If there is still a concept without an interpretation, we always can find one satisfying the condition in step 1 since there is no cycle. In step 2, no concept reachable from α can have an empty interpretation, so the assignment does not violate any subconcept relations.

Semantic Networks with

Semantic Networks with Negation

Satisfiability of a Semantic Network

Networks with Negation and

...

isa-reasoning

Theorem (Inheritance in strict networks with negation)

 $\Theta \models \alpha_1$ isa α_2 if and only if one of the following conditions is satisfied:

- $\Theta \models \bot$.
- There is a path from α_1 to $\overline{\alpha_1}$ in G_{Θ} .
- If there is a path from $\overline{\alpha_2}$ to α_2 in G_{Θ} .
- There is a path from α_1 to α_2 in G_{Θ} .

Proof (sketch).

Soundness is obvious.

Completeness can be shown using the same argument that we used for completeness of the Satisfiability Theorem and the fact that we can start the construction process with $\alpha_1^{\mathcal{I}} = \{d\}$ and $\overline{\alpha_2}^{\mathcal{I}} = \{d\}$.

Computational complexity

Theorem (Complexity of strict inheritance with negation and conjunction)

The reasoning problem for strict inheritance networks with conjunction and negation is coNP-complete.

Proof (sketch).

We show hardness by a reduction from 3SAT.

Let $D = C_1 \wedge ... \wedge C_n$ be formula in CNF with exactly three literals per clause (over atoms a_i).

Let $\sigma(C_i)$ be the following translation:

$$a_1 \lor a_2 \lor a_3 \mapsto (\mathsf{not}\, a_1 \, \mathsf{and} \, \mathsf{not}\, a_2) \, \mathsf{isa} \, a_3$$

$$\neg a_1 \lor a_2 \lor a_3 \mapsto (a_1 \, \mathsf{and} \, \mathsf{not}\, a_2) \, \mathsf{isa} \, a_3$$

$$\neg a_1 \lor \neg a_2 \lor a_3 \mapsto (a_1 \, \mathsf{and}\, a_2) \, \mathsf{isa} \, a_3$$

$$\neg a_1 \lor \neg a_2 \lor \neg a_3 \mapsto (a_1 \, \mathsf{and}\, a_2) \, \mathsf{isa} \, (\mathsf{not}\, a_3)$$

Extend σ to CNF formulae, and show that D is unsatisfiable iff $\sigma(D) \models \bot$. \Box

Conclusion

- Strict inheritance networks are easy
- Inheritance corresponds to a universally quantified implication
- If concepts are atomic, everything can be decided in poly. time
- We can deal with negation without increasing the complexity
- Conjunction and negation, however, make the reasoning problem hard
- ... as hard as propositional unsatisfiability.
