### Motivation: Reasoning services

What do we want to know?

- We want to check whether the knowledge base is reasonable:
  - Is each defined concept in a TBox satisfiable?
  - Is a given TBox satisfiable?
  - Is a given ABox satisfiable?
- What can we conclude from the represented knowledge?
  - Is concept X subsumed by concept Y?
  - Is an object a instance of a concept X?
- These problems can be reduced to logical satisfiability or implication – using the logical semantics.
- However, we take a different route: we will try to simplify these problems and then we specify direct inference methods.

General ABox Reasoning Services

Summary and Outlook

### Satisfiability of concept descriptions

Given a concept description *C* in "isolation", i.e., in an empty TBox, is *C* satisfiable?

### Test:

- Does there exist an interpretation  $\mathcal{I}$  such that  $C^{\mathcal{I}} \neq \emptyset$ ?
- Translated into FOL: Is the formula  $\exists x C(x)$  satisfiable?

### Example

Woman  $\sqcap$  ( $\leq$  0 has-child)  $\sqcap$  ( $\geq$  1 has-child) is unsatisfiable.

### Satisfiability of concept descriptions in a TBox

Given a TBox T and a concept description C, is C satisfiable?

### Test:

- Does there exist a model  $\mathcal{I}$  of  $\mathcal{T}$  such that  $C^{\mathcal{I}} \neq \emptyset$ ?
- Translated into FOL: Is the formula  $\exists x C(x)$  together with the formulae resulting from the translation of  $\mathcal{T}$  satisfiable?

### Example

Mother-without-daughter  $\sqcap \forall has-child.Female is$  unsatisfiable, given our previously specified family TBox.

Summary and Outlook

## Normalization

Unfolding

We can reduce satisfiability problem of concept descriptions in a TBox to the satisfiability problem of concept descriptions in the empty TBox.

Idea:

- Since TBoxes are cycle-free, one can understand a concept definition as a kind of "macro".
- For a given TBox *T* and a given concept description *C*, all defined concept symbols appearing in *C* can be expanded until *C* contains only undefined concept symbols.
- An expanded concept description is then satisfiable if and only if *C* is satisfiable in  $\mathcal{T}$ .
- *Problem*: What do we do with partial definitions (using □)?

Motivation

Basic Reasoning Services

Eliminating the TBox

Normalization Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

### Normalized terminologies

- A terminology is called normalized when it does not contain definitions fo the form A ⊆ C.
- In order to normalize a terminology, replace

$$A \sqsubseteq C$$

by

$$A = A^{++}C,$$

\* - -

# where $A^*$ is a fresh concept symbol (not appearing elsewhere in T).

If T is a terminology, the normalized terminology is denoted by T̃. Motivation

Eliminating the TBox

Normalization

General TBox Reasoning Services

General ABox Reasoning Services

### Theorem (Normalization invariance)

If  $\mathcal{I}$  is a model of the terminology  $\mathcal{T}$ , then there exists a model  $\mathcal{I}'$  of  $\widetilde{\mathcal{T}}$  such that for all concept symbols A occurring in  $\mathcal{T}$ , it holds  $A^{\mathcal{I}} = A^{\mathcal{I}'}$ , and vice versa.

### Proof.

"⇒": Let  $\mathcal{I}$  be a model of  $\mathcal{T}$ . This model should be extended to  $\mathcal{I}'$  so that the freshly introduced concept symbols also get interpretations. Assume  $(A \sqsubseteq C) \in \mathcal{T}$ , i.e., we have  $(A \doteq A^* \sqcap C) \in \widetilde{\mathcal{T}}$ . Then set  $A^{*\mathcal{I}'} := A^{\mathcal{I}}$ .  $\mathcal{I}'$  obviously satisfies  $\widetilde{\mathcal{T}}$  and has the same interpretation for all symbols in  $\mathcal{T}$ . " $\Leftarrow$ ": Given a model  $\mathcal{I}'$  of  $\widetilde{\mathcal{T}}$ , its restriction to symbols of  $\mathcal{T}$  is the

Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

Summary and Outlook

interpretation we look for.

- We say that a normalized TBox is unfolded by one step when all defined concept symbols on the right sides are replaced by their defining terms.
- Example: Mother = Woman □... is unfolded to Mother = (Human □ Female) □...
- We write U(T) to denote a one-step unfolding and U<sup>n</sup>(T) to denote an *n*-step unfolding.
- We say that  $\mathcal{T}$  is unfolded if  $U(\mathcal{T}) = \mathcal{T}$ .
- $U^n(\mathcal{T})$  is called the unfolding of  $\mathcal{T}$  if  $U^n(\mathcal{T}) = U^{n+1}(\mathcal{T})$ . If such an unfolding exists, it is denoted by  $\widehat{\mathcal{T}}$ .

Motivation

Basic Reasoning Services

Eliminating the TBox

Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

### Properties of unfoldings (1): Existence

### Theorem (Existence of unfolded terminology)

Each normalized terminology  ${\cal T}$  can be unfolded, i.e., its unfolding  $\widehat{{\cal T}}$  exists.

### Proof idea.

The main reason is that terminologies have to be cycle-free. The proof can be done by induction of the definition depth of concepts.

Motivation

Basic Reasoning Services

Eliminating the TBox Normalization

Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

# Theorem (Model equivalence for unfolded terminologies) $\mathcal{I}$ is a model of a normalized terminology $\mathcal{T}$ if and only if it is a model of $\hat{\mathcal{T}}$ .

### Proof sketch.

" $\Rightarrow$ ": Let  $\mathcal{I}$  be a model of  $\mathcal{T}$ . Then it is also a model of  $U(\mathcal{T})$ , since on the right side of the definitions only terms with identical interpretations are substituted. However, then it must also be a model of  $\widehat{\mathcal{T}}$ .

"'\equiv ": Let  $\mathcal{I}$  be a model for  $U(\mathcal{T})$ . Clearly, this is also a model of  $\mathcal{T}$  (with the same argument as above). This means that any model  $\widehat{\mathcal{T}}$  is also a model of  $\mathcal{T}$ .

#### Motivation

Basic Reasoning Services

Eliminating the TBox Normalization

Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

### Generating models

- All concept and role names not occurring on the left hand side of definitions in a terminology T are called primitive components.
- Interpretations restricted to primitive components are called initial interpretations.

### Theorem (Model extension)

For each initial interpretation  $\mathcal{J}$  of a normalized TBox, there exists a unique interpretation  $\mathcal{I}$  extending  $\mathcal{J}$  and satisfying  $\mathcal{T}$ .

### Proof idea.

Use  $\widehat{\mathcal{T}}$  and compute an interpretation for all defined symbols.

### Corollary (Model existence for TBoxes)

### Each TBox has at least one model.

Reasoning Services

Eliminating the TBox Normalization

Unfolding

General TBox Reasoning Services

General ABox Reasoning Services

### Unfolding of concept descriptions

- Similar to the unfolding of TBoxes, we can define the unfolding of a concept description.
- We write  $\widehat{C}$  for the unfolded version of *C*.

### Theorem (Satisfiability of unfolded concepts)

An concept description C is satisfiable in a terminology  $\mathcal{T}$  if and only if  $\widehat{C}$  satisfiable in an empty terminology.

### Proof.

" $\Rightarrow$ ": trivial.

"⇐": Use the interpretation for all the symbols in  $\widehat{C}$  to generate an initial interpretation of  $\mathcal{T}$ . Then extend it to a full model  $\mathcal{I}$  of  $\mathcal{T}$ . This satisfies  $\mathcal{T}$  as well as  $\widehat{C}$ . Since  $\widehat{C}^{\mathcal{I}} = C^{\mathcal{I}}$ , it satisfies also C.

Summary and Outlook

### Subsumption

- Subsumption vs. Satisfiability
- Classification

### Subsumption in a TBox

Given a terminology  $\mathcal{T}$  and two concept descriptions C and D, is C subsumed by (or a sub-concept of) D in  $\mathcal{T}$  (symb.  $C \sqsubseteq_{\mathcal{T}} D$ )?

### Test:

- Is *C* interpreted as a subset of *D* in each model  $\mathcal{I}$  of  $\mathcal{T}$ , i.e.  $C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$ ?
- Is the formula  $\forall x (C(x) \rightarrow D(x))$  a logical consequence of the translation of  $\mathcal{T}$  into FOL?

### Example

Given our family TBox, it holds  $\texttt{Grandmother} \sqsubseteq_{\mathcal{T}} \texttt{Mother}$ .

General TBox Reasoning Services

Subsumption

Subsumption vs Satisfiability

General ABox Reasoning Services

### Subsumption (without a TBox)

Given two concept descriptions *C* and *D*, is *C* subsumed by *D* regardless of a TBox (or in an empty TBox) (symb.  $C \sqsubseteq D$ )?

### Test:

- Is *C* interpreted as a subset of *D* for all interpretations  $\mathcal{I}$  $(C^{\mathcal{I}} \subseteq D^{\mathcal{I}})$ ?
- Is the formula  $\forall x (C(x) \rightarrow D(x))$  logically valid?

### Example

Clearly, Human  $\sqcap$  Female  $\sqsubseteq$  Human.

General TBox Reasoning Services

Subsumption

Subsumption vs. Satisfiability

Classification

General ABox Reasoning Services

Summary and Outlook

Subsumption in a TBox can be reduced to subsumption in the empty TBox:

... normalize and unfold TBox and concept descriptions.

Subsumption in the empty TBox can be reduced to unsatisfiability:

...  $C \sqsubseteq D$  iff  $C \sqcap \neg D$  is unsatisfiable.

Unsatisfiability can be reduced to subsumption: ... *C* is unsatisfiable iff  $C \sqsubseteq (C \sqcap \neg C)$ .

### relations later when be answered Problem can be reduced to subsumption checking:

then it is a generalized sorting problem!

Example

Compute all subsumption relationships (and represent them using only a minimal number of relationships)!

Useful in order to:

Classification

- check the modeling
- use the precomputed subsumption queries have to

Summary and Outlook

### ABox Satisfiability

- Instances
- Realization and Retrieval

### Satisfiability of an ABox

Given an ABox  $\mathcal{A}$ , does this set of assertions have a model?

Notice: ABoxes representing the real world, should always have a model.

Example

The ABox

$$X:(\forall r.\neg C), Y:C, (X,Y):r$$

is not satisfiable.

Motivation

Eliminating the TBox

General TBox Reasoning Services

General ABox Reasoning Services

ABox Satisfiability

Instances Realization and Retrieval

Summary and Outlook

January 17, 2013

Nebel, Wölfl, Hué - KRR

### ABox satisfiability in a TBox

Given an ABox A and a TBox T, is A consistent with the terminology introduced in T, i.e., is  $T \cup A$  satisfiable?

### Example

If we extend our example with

MARGRET: Woman (DIANA,MARGRET): has-child,

then the ABox becomes unsatisfiable in the given TBox.

Problem is reducible to satisfiability of an ABox:
... normalize terminology, then unfold all concept and role descriptions in the ABox

#### Motivation

Basic Reasoning Services

Eliminating the TBox

General TBox Reasoning Services

General ABox Reasoning Services

ABox Satisfiability

Instances Realization and Retrieval

### Instance relations

Which additional ABox formulae of the form a: C follow logically from a given ABox and TBox?

- Is  $a^{\mathcal{I}} \in C^{\mathcal{I}}$  true in all models  $\mathcal{I}$  of  $\mathcal{T} \cup \mathcal{A}$ ?
- Does the formula C(a) logically follow from the translation of  $\mathcal{A}$  and  $\mathcal{T}$  to predicate logic?

**Reductions:** 

- Instance relations wrt. an ABox and a TBox can be reduced to instance relations wrt. ABox: use normalization and unfolding
- Instance relations in an ABox can be reduced to ABox unsatisfiability:

a: C holds in  $\mathcal{A} \iff \mathcal{A} \cup \{a: \neg C\}$  is unsatisfiable

General TBox Reasoning Services

General ABox Reasoning Services

ABox Satisfiability

Instances Realization and Betrieval

### Realization

For a given object *a*, determine the most specialized concept symbols such that *a* is an instance of these concepts

### Motivation:

- Similar to classification
- Is the minimal representation of the instance relations (in the set of concept symbols)
- Will give us faster answers for instance queries!

Reduction: Can be reduced to (a sequence of) instance relation tests.

Motivation

Basic Reasoning Services

Eliminating the TBox

General TBox Reasoning Services

General ABox Reasoning Services

ABox Satisfiability

Realization and Retrieval

### Retrieval

Given a concept description *C*, determine the set of all (specified) instances of the concept description.

### Example

We ask for all instances of the concept Male. For our TBOX/ABox we will get the answer CHARLES, ANDREW, EDWARD, WILLIAM.

- Reduction: Compute the set of instances by testing the instance relation for each object!
- Implementation: Realization can be used to speed this up
