Teaching materials

- no script, but these slides available on the web
- three textbooks exist, but not necessary for this course:
 - Geffner and Bonet (2013), A Concise Introduction to Models and Methods for Automated Planning (comes closest to this course, includes relatively recent research results a few copies available in the Faculty of Engineering library)
 - Ghallab, Nau, and Traverso (2004), Automated Planning:
 Theory and Practice
 (very different from this course, quite outdated)
 - Ghallab, Nau, and Traverso (2016), Automated Planning and Acting (heavily modified rewrite of the above, still quite different from this course)
- additional resources: bibliography page on web + ask us!

Credit points & exam

About...
Coordinates
Rules

Introduction

- 6 ECTS points
- special lecture in specialization field Cognitive Technical Systems
- oral exam of about 30 minutes for B.Sc. students
- written or oral exam for M.Sc. students (likely written)

Prerequisites

About..
Coordinate

Introductio

Course prerequisites:

- propositional logic: syntax and semantics
- foundations of Al: search, heuristic search
- computational complexity theory: decision problems, reductions, NP-completeness

October 16th, 2017

B. Nebel, R. Mattmüller - Al Planning

10 / 25

Exercises

12 / 25

About...
Coordinates

Introduction

Exercises (written assignments):

- handed out once a week
- due one week later, before the lecture
- discussed in the next exercise session
- \blacksquare may be solved in groups of two students (2 \neq 3)
- successful participation prerequisite for exam admission

October 16th, 2017 B. Nebel, R. Mattmüller – Al Planning

October 16th, 2017

B. Nebel, R. Mattmüller - Al Planning

11 / 25

Admission to exam

- points can be earned for "reasonable" solutions to exercises.
- at least 50% of points prerequisite for admission to final exam.

October 16th, 2017

B. Nebel, R. Mattmüller - Al Planning

13 / 25

What is plagiarism?

Plagiarism

■ http://en.wikipedia.org/wiki/Plagiarism is a good intro

Consequence: no admission to the final exam.

- We may (!) be generous on first offense.
- Don't tell us "We did the work together."
- Don't tell us "I did not know this was not allowed."

Introduction

Objectives

What is planning?

Planning

"Planning is the art and practice of thinking before acting."

- Patrik Haslum

- intelligent decision making: What actions to take?
- general-purpose problem representation
- algorithms for solving any problem expressible in the representation
- application areas:
 - high-level planning for intelligent robots
 - autonomous systems: NASA Deep Space One, ...
 - problem solving (single-agent games like Rubik's cube)

16 / 25

Why is planning difficult?

- solutions to classical planning problems are paths from an initial state to a goal state in the transition graph
 - efficiently solvable by Dijkstra's algorithm in $O(|V|\log|V|+|E|)$ time
 - Why don't we solve all planning problems this way?
- state spaces may be huge: 10¹⁰, 10¹⁰⁰, 10¹⁰⁰⁰,... states
 - constructing the transition graph is infeasible!
 - planning algorithms try to avoid constructing whole graph
- planning algorithms are often much more efficient than obvious solution methods constructing the transition graph and using e.g. Dijkstra's algorithm

Properties of the world: dynamics

UNI FREIBURG

About.

What is planning

Deterministic dynamics

Action + current state uniquely determine successor state.

Nondeterministic dynamics

For each action and current state there may be several possible successor states.

Probabilistic dynamics

For each action and current state there is a probability distribution over possible successor states.

Analogy: deterministic versus nondeterministic automata

About.

20 / 25

Introduction

What is planning

Dynamics

Objectives Planning vs. gam

theory Summary

Properties of the world: observability

Full observability

Observations determine current world state uniquely.

Partial observability

Observations determine current world state only partially: we only know that current state is one of several possible ones.

No observability

There are no observations to narrow down possible current states. However, can use knowledge of action dynamics to deduce which states we might be in.

Consequence: If observability is not full, must represent the knowledge an agent has.

October 16th, 2017

B. Nebel, R. Mattmüller - Al Planning

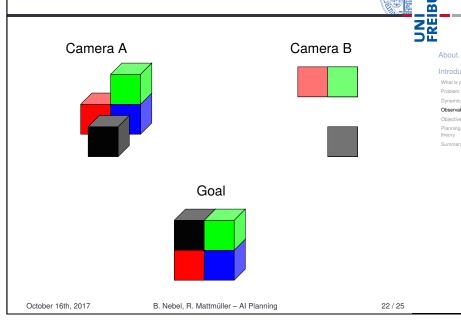

21 / 25

Different objectives

- Reach a goal state.
 - Example: Earn 500 Euros.
- 2 Stay in goal states indefinitely (infinite horizon).
 - Example: Never allow bank account balance to be negative.
- Maximize the probability of reaching a goal state.
 - Example: To be able to finance buying a house by 2027 study hard and save money.
- 4 Collect the maximal expected rewards/minimal expected costs (infinite horizon).
 - **Example:** Maximize your future income.

5

What difference does observability make?

Relation to games and game theory

- Game theory addresses decision making in multi-agent setting: "Assuming that the other agents are rational, what do I have to do to achieve my goals?"
- Game theory is related to multi-agent planning.
- In this course we concentrate on single-agent planning.
- Some of the techniques are also applicable to special cases of multi-agent planning.
 - Example: Finding a winning strategy of a game like chess. In this case it is not necessary to distinguish between an intelligent opponent and a randomly behaving opponent.
- Game theory in general is about optimal strategies which do not necessarily guarantee winning. For example card games like poker do not have a winning strategy.

Planning vs. gam

Objectives

October 16th, 2017

What do you learn in this course?

UNI FREIBURG

25 / 25

- emphasis on classical planning ("simplest" case)
- brief digression to nondeterministic planning
- theoretical background for planning
 - formal problem definition
 - basic theoretical notions (e.g., normal forms, progression, regression)
 - computational complexity of planning
- algorithms for planning:
 - based on heuristic search
 - based on exhaustive search with logic-based data structures such as BDDs (if time permits)

Many of these techniques are applicable to problems outside AI as well.

hands-on experience with a classical planner (probably)
