Exercise Sheet 10

Due: Friday, January 12th, 2018

Exercise 10.1 (EVMDDs, 2+2 points)

An EVMDD is called *reduced* if it contains no two isomorphic subgraphs and if it contains no nodes where all outgoing edges lead to the same successor node and carry the same weight. It is *canonical* if for each node, the minimal outgoing edge weight is zero.

- Let $c_1 = xy + y$ for variables x, y with $\mathcal{D}_x = \mathcal{D}_y = \{0, 1\}$. Draw the canonical reduced ordered EVMDDs for c_1 for both possible variable orders (x, y) and (y, x) . Compare their sizes.
- Let $c_2 = x \cdot (2 + y + z) - u^2 + 7$ for variables x, y, z, u with $\mathcal{D}_x = \mathcal{D}_y = \mathcal{D}_z = \{0, 1\}$ and $\mathcal{D}_u = \{0, 1, 2\}$. Draw the canonical reduced ordered EVMDD for c_2 and variable order x, y, z, u .

Exercise 10.2 (EVMDD sizes and variable orders, 2 points)

Let v_0, \dots, v_{2n-1} be variables with domains $\mathcal{D}_{v_i} = \{0, \dots, k-1\}$ for all $i = 0, \dots, 2n-1$, let $\pi : \{0, \dots, 2n-1\} \rightarrow \{0, \dots, 2n-1\}$ be a permutation of the variables, let $\kappa_j \in \mathbb{N}$, $j = 0, \dots, n-1$, be natural numbers, and let $c = \sum_{j=0}^{n-1} \kappa_j v_{\pi(2j)} v_{\pi(2j+1)}$ be an arithmetic function over v_0, \dots, v_{2n-1} . Intuitively, c is a weighted sum of products of two variables each, such that no variable occurs in more than one product subterm. Show that there exists a variable order for v_0, \dots, v_{2n-1} such that there exists an EVMDD with that order that represents the function c and that has a size (number of edges) in the order of $n \cdot k^2$.

Hint: Consider the example $c = 2v_0v_3 + 6v_1v_5 + 4v_2v_4$. How should the variables be ordered to minimize the size of the EVMDD?

Exercise 10.3 (Evaluating states with EVMDDs, 1 point)

Consider a cost function represented by the EVMDD on the right.

Let s be a state with $s(x) = 1$ and $s(y) = 2$. To which value does the EVMDD evaluate for state s ?

Exercise 10.4 (EVMDD-based action compilation, 2+1 points)

Consider again the EVMDD from Exercise 10.3. Assume it encodes the cost c_{o_1} of operator $o_1 = \langle z = 1 \wedge u = 1, x := 0 \rangle$.

- Give the EVMDD-based action compilation of o_1 using this EVMDD.
- Let $\Pi = \langle V, I, O, \gamma, (c_o)_{o \in O} \rangle$ with $V = \{x, y, z, u\}$, $\mathcal{D}_x = \mathcal{D}_z = \mathcal{D}_u = \{0, 1\}$ and $\mathcal{D}_y = \{0, 1, 2\}$, initial state I with $I(x) = I(y) = I(z) = I(u) = 1$, operators $O = \{o_1, o_2\}$ with o_1 as above and $o_2 = \langle x = 0, z := 0 \rangle$ with cost function $c_{o_2} = 1$ and goal formula $\gamma = (z = 0)$. Give an optimal plan π for Π and an optimal plan π' for the EVMDD-based action compilation of Π and their respective costs.

You may and should solve the exercise sheets in groups of two. Please state both names on your solution.
