# About the course

October 23rd, 2019

B. Nebel, R. Mattmüller – AI Planning

2 / 27

## People

### Lecturers

Dr. Robert Mattmüller

- **email:** [mattmuel@informatik.uni-freiburg.de](mailto:mattmuel@informatik.uni-freiburg.de)
- **office:** room 052-00-042
- **consultation:** by appointment (email) or just come to my office

Prof. Dr. Bernhard Nebel

- **email:** [nebel@informatik.uni-freiburg.de](mailto:nebel@informatik.uni-freiburg.de)
- **office:** room 052-00-029
- **consultation:** Tuesday, 12:00-13:00 and by appointment

### Course web site

<http://gki.informatik.uni-freiburg.de/teaching/ws1920/aip/>

- **main page:** course description
- **lecture page:** slides
- **exercise page:** assignments, software
- **bibliography page:** literature references and papers

## Teaching materials

About...  
Coordinates  
Rules  
Introduction

- no script, but these slides available on the web
- three textbooks exist, but not necessary for this course:
  - Geffner and Bonet (2013), A Concise Introduction to Models and Methods for Automated Planning (comes closest to this course, includes relatively recent research results – a few copies available in the Faculty of Engineering library)
  - Ghallab, Nau, and Traverso (2004), Automated Planning: Theory and Practice (very different from this course, quite outdated)
  - Ghallab, Nau, and Traverso (2016), Automated Planning and Acting (heavily modified rewrite of the above, still quite different from this course)

## Teaching materials

About...  
Coordinates  
Rules  
Introduction

- other resources:
  - Muise, Haslum, Magazzeni, and Lipovetzky (2019), An Introduction to the Planning Domain Definition Language (about the modeling language, not so much about algorithms; pretty nice, though)
  - Website: <http://planning.domains/>
  - additional resources: bibliography page on web + ask us!

### Acknowledgments:

- slides based on earlier courses by Jussi Rintanen, Bernhard Nebel and Malte Helmert
- many figures by Gabi Röger

### Students of Computer Science:

- Master of Science, any year
- Bachelor of Science, ~3rd year

### Other students:

- advanced study period (~4th year)

### Course prerequisites:

- **propositional logic**: syntax and semantics
- **foundations of AI**: search, heuristic search
- **computational complexity theory**: decision problems, reductions, NP-completeness

- 6 ECTS points
- specialization lecture
- **oral exam** of about 30 minutes for computer science B.Sc. students
- **written or oral exam** for M.Sc. students and students in study programs other than computer science (likely written)

## Exercises (written assignments):

- handed out once a week
- due one week later, before the lecture
- discussed in the next exercise session
- may be solved in groups of two students ( $2 \neq 3$ )
- successful participation prerequisite to pass the “Studienleistung”

- points can be earned for “reasonable” solutions to exercises.
- at least 50% of points needed to pass the “Studienleistung”.

## What is plagiarism?

- passing off solutions as your own that are not based on your ideas (work of other students, Internet, books, ...)
- <http://en.wikipedia.org/wiki/Plagiarism> is a good intro

**Consequence:** no admission to the final exam.

- We may (!) be generous on first offense.
- Don't tell us “We did the work together.”
- Don't tell us “I did not know this was not allowed.”

# Planning in the AI landscape

(hugely simplified ...)

**Symbolic AI, e. g. ...**

Knowledge representation and reasoning

Logic

**AI planning, search**

**You are here!**

- Knowledge and symbols
- Often model-based
- Explainability: ✓

About...  
Introduction  
What is planning?  
Problem classes  
Dynamics  
Observability  
Objectives  
Planning vs. game theory  
Summary

**Sub-symbolic AI, e. g. ...**

Perception (vision, ...)

Pattern Recognition

(Deep) Learning

- Data, no symbols
- Often model-free
- Explainability: ✗

# What is planning?

## Planning

“Planning is the art and practice of thinking before acting.”

— Patrik Haslum

- intelligent decision making: What actions to take?
- general-purpose problem representation
- algorithms for solving any problem expressible in the representation
- application areas:
  - high-level planning for intelligent robots
  - autonomous systems: NASA Deep Space One, ...
  - problem solving (single-agent games like Rubik’s cube)

About...  
Introduction  
What is planning?  
Problem classes  
Dynamics  
Observability  
Objectives  
Planning vs. game theory  
Summary

# Why is planning difficult?

- solutions to classical planning problems are paths from an initial state to a goal state in the transition graph
  - efficiently solvable by Dijkstra’s algorithm in  $O(|V| \log |V| + |E|)$  time
  - Why don’t we solve all planning problems this way?
- state spaces may be huge:  $10^{10}, 10^{100}, 10^{1000}, \dots$  states
  - constructing the transition graph is infeasible!
  - planning algorithms try to avoid constructing whole graph
- planning algorithms are often much more efficient than obvious solution methods constructing the transition graph and using e.g. Dijkstra’s algorithm

# Properties of the world: dynamics

## Deterministic dynamics

Action + current state **uniquely** determine successor state.

## Nondeterministic dynamics

For each action and current state there may be **several possible** successor states.

## Probabilistic dynamics

For each action and current state there is a **probability distribution** over possible successor states.

**Analogy**: deterministic versus nondeterministic automata

- Problem classes
- Dynamics
- Observability
- Objectives
- Planning vs. game theory
- Summary

# Properties of the world: observability

## Full observability

Observations determine current world state **uniquely**.

## Partial observability

Observations determine current world state **only partially**: we only know that current state is one of several possible ones.

## No observability

There are **no observations** to narrow down possible current states. However, can use knowledge of **action dynamics** to deduce which states we might be in.

**Consequence**: If observability is not full, must represent the **knowledge** an agent has.

Goal

- About...
- Introduction
- What is planning?
- Problem classes
- Dynamics
- Observability
- Objectives
- Planning vs. game theory
- Summary

- 1 Reach a goal state.
  - **Example:** Earn 500 Euros.
- 2 Stay in goal states indefinitely (infinite horizon).
  - **Example:** Never allow bank account balance to be negative.
- 3 Maximize the probability of reaching a goal state.
  - **Example:** To be able to finance buying a house by 2029 study hard and save money.
- 4 Collect the maximal **expected** rewards/minimal expected costs (infinite horizon).
  - **Example:** Maximize your future income.
- 5 ...

About...

Introduction

What is planning?

Problem classes

Dynamics

Observability

Objectives

Planning vs. game theory

Summary

- Game theory addresses decision making in multi-agent setting: “Assuming that the other agents are rational, what do I have to do to achieve my goals?”
- Game theory is related to **multi-agent planning**.
- In this course we concentrate on **single-agent planning**.
- Some of the techniques are also applicable to special cases of multi-agent planning.
  - **Example:** Finding a **winning strategy** of a game like chess. In this case it is not necessary to distinguish between **an intelligent opponent** and **a randomly behaving opponent**.
- Game theory in general is about **optimal strategies** which do not necessarily guarantee winning. For example card games like poker do not have a winning strategy.

About...

Introduction

What is planning?

Problem classes

Dynamics

Observability

Objectives

Planning vs. game theory

Summary

- emphasis on **classical** planning (“simplest” case)
  - brief digression to **nondeterministic** planning
  - **theoretical background** for planning
    - formal **problem definition**
    - basic **theoretical notions** (e. g., normal forms, progression, regression)
    - **computational complexity** of planning
  - **algorithms** for planning:
    - based on **heuristic search**
    - based on exhaustive search with logic-based data structures such as BDDs (if time permits)
- Many of these techniques are applicable to problems outside AI as well.
- **hands-on experience** with a classical planner (probably)
