Is there **anything** we know about states in a planning problem?

Definition (Invariant)

An invariant \mathcal{I} is a formula over the state variables such that for all states s reachable from s_1 it holds $s \models \mathcal{I}$.

SAT
Modelling

What are Invariants?

Predicates:

- $on(x, y)$ – x lies directly on y .
- $free(x)$ – x has no block above it.

Actions:

- $pickup(x)$ – pick up x , if it is free.
- $putdown(x, y)$ – put x on y , if y is free (*table* is always free).

What are Invariants?

Predicates:

- $on(x, y)$ – x lies directly on y .
- $free(x)$ – x has no block above it.

Actions:

- $pickup(x)$ – pick up x , if it is free.
- $putdown(x, y)$ – put x on y , if y is free (*table* is always free).

Are the following formulae invariants?

- 1 $\forall b \in Block : (\exists b' \in Block : on(b', b)) \vee free(b)$
- 2 $\forall b \in Block : on(b, table)$
- 3 $\forall b, b' \in Block : \neg on(b', b) \vee \neg on(b, b')$

What are Invariants?

Predicates:

- $on(x, y)$ – x lies directly on y .
- $free(x)$ – x has no block above it.

Actions:

- $pickup(x)$ – pick up x , if it is free.
- $putdown(x, y)$ – put x on y , if y is free (*table* is always free).

Are the following formulae invariants?

- 1 $\forall b \in Block : (\exists b' \in Block : on(b', b)) \vee free(b)$ — **Yes.**
- 2 $\forall b \in Block : on(b, table)$
- 3 $\forall b, b' \in Block : \neg on(b', b) \vee \neg on(b, b')$

What are Invariants?

Predicates:

- $on(x,y)$ – x lies directly on y .
- $free(x)$ – x has no block above it.

Actions:

- $pickup(x)$ – pick up x , if it is free.
- $putdown(x,y)$ – put x on y , if y is free (*table* is always free).

Are the following formulae invariants?

- 1 $\forall b \in Block : (\exists b' \in Block : on(b', b)) \vee free(b)$ — **Yes.**
- 2 $\forall b \in Block : on(b, table)$ — **No.**
- 3 $\forall b, b' \in Block : \neg on(b', b) \vee \neg on(b, b')$

What are Invariants?

Predicates:

- $on(x, y)$ – x lies directly on y .
- $free(x)$ – x has no block above it.

Actions:

- $pickup(x)$ – pick up x , if it is free.

$$a_1^t \rightarrow \neg a_2^t \quad \forall a_1, a_2 \in A \text{ with } del(a_1) \cap pre(a_2) \neq \emptyset \\ \rightarrow \text{quadratic effort.}$$

$$a^t \rightarrow del_v^t \quad \forall a \in A, v \in del(a) \\ del_v^t \rightarrow \neg a^t \quad \forall a \in A, v \in pre(a) \\ \rightarrow \text{linear effort.}$$

Further implications?

The resulting state must always be the same!

Thus we forbid two actions a_1, a_2 with $del(a_1) \cap add(a_2) \neq \emptyset$ to be executed in parallel.

(Otherwise the resulting state would not be unique.)

Planning in
SAT

Invariants

\forall -step

\exists -step

Improvements for classical planning:

- Extension to conditional effects [Rintanen,Heljanko,Niemelä'06].
- Relaxed \exists -step [Wehrle&Rintanen'07].
- Parallel SAT search [Rintanen'04] [Rintanen,Heljanko,Niemelä'06].
- Specialised heuristics for SAT solvers [Rintanen'10a] [Rintanen'10b].
- Improved memory management [Rintanen'12].
- Incremental SAT-solving [Gocht&Balyo'17].
