

Multi-Agent Systems

Modal Logic for Multi-Agent Systems, Syntax and Semantics

Albert-Ludwigs-Universität Freiburg

**UNI
FREIBURG**

Bernhard Nebel, Rolf Bergdoll, and Thorsten Engesser

Winter Term 2019/20

- Recap
 - Situations from various domains (Programs, Knowledge, Belief, Desire, Obligation) can nicely be modeled using **graphical models**.
 - **Kripke models** formalize graphical models.
 - By constraining the **accessibility relations** of Kripke frames we obtain **classes** that correspond to above concepts (Knowledge, Belief etc.)
- Today
 - Introducing formal languages to talk about Kripke models and thus generally about Knowledge, Belief, Desire, Obligation ...

Modal Logics

Kripke Frame

Given a countable set of edge labels \mathcal{I} , a **Kripke Frame** is a tuple (W, R) such that:

- W is a non-empty set of possible worlds, and
- $R : \mathcal{I} \rightarrow 2^{W \times W}$ maps each $I \in \mathcal{I}$ to a binary relation $R(I)$ on W (called the **accessibility relation** of I).

Kripke Model

$M = (W, R, V)$ is a **Kripke Model** where:

- (W, R) is a Kripke frame, and
- $V : \mathcal{P} \rightarrow 2^W$ is called the **valuation** of a set of node labels \mathcal{P} .

The language \mathcal{F} of modal logic is inductively defined as follows:

- $\mathcal{P} \subseteq \mathcal{F}$.
- $\{\top, \perp\} \subseteq \mathcal{F}$.
- If $\varphi \in \mathcal{F}$, then $\neg\varphi \in \mathcal{F}$.
- If $\varphi, \psi \in \mathcal{F}$ then $(\varphi \wedge \psi), (\varphi \vee \psi), (\varphi \rightarrow \psi), (\varphi \leftrightarrow \psi) \in \mathcal{F}$
- If $\varphi \in \mathcal{F}$ and $I \in \mathcal{I}$, then $[I]\varphi, \langle I \rangle \varphi \in \mathcal{F}$.

- Alethic logic (Necessity): \Box, \Diamond
- Epistemic logic (Knowledge): $\mathbf{K}, \hat{\mathbf{K}}$
- Doxastic logic (Belief): $\mathbf{B}, \hat{\mathbf{B}}$
- Deontic logic (Obligation): \mathbf{O}, \mathbf{P}
- Multi-Agent Epistemic logic: Agent name as subscript, e.g., $\mathbf{K}_{mary} \hat{\mathbf{K}}_{john} sun_shining$
- **Notation**: Sometimes, we will decide that **[I]** shall be read in context of epistemic logic, sometimes we will decide to read it in context of deontic logic. We then may also sometimes write K_I (i.e., Agent I knows) , and O_I (i.e., Agent I ought to) instead of **[I]**.

Given a Kripke model M , a possible world w of M , and a formula φ . We define when φ is true at w , written $M, w \models \varphi$:

- $M, w \models p$ iff $w \in V(p)$, for atomic formulae $p \in \mathcal{P}$.
- $M, w \not\models \perp$.
- $M, w \models \top$.
- $M, w \models \neg\varphi$ iff $M, w \not\models \varphi$.
- $M, w \models (\varphi \wedge \psi)$ iff $M, w \models \varphi$ and $M, w \models \psi$.
- $M, w \models (\varphi \vee \psi)$ iff $M, w \models \varphi$ or $M, w \models \psi$.
- $M, w \models (\varphi \rightarrow \psi)$ iff $M, w \not\models \varphi$ or $M, w \models \psi$.
- $M, w \models (\varphi \leftrightarrow \psi)$ iff $M, w \models (\varphi \rightarrow \psi)$ and $M, w \models (\psi \rightarrow \varphi)$.
- $M, w \models \llbracket I \rrbracket \varphi$ iff for every u : if $(w, u) \in R(I)$ then $M, u \models \varphi$.
- $M, w \models \langle I \rangle \varphi$ iff for some u : $(w, u) \in R(I)$ and $M, u \models \varphi$.

1 $M, w \models \llbracket I \rrbracket \varphi$ iff $M, w \models \neg \langle I \rangle \neg \varphi$

2 $M, w \models \langle I \rangle \varphi$ iff $M, w \models \neg \llbracket I \rrbracket \neg \varphi$

■ To see that (1):

■ $M, w \models \llbracket I \rrbracket \varphi$

■ iff for every u : if $(w, u) \in R(I)$ then $M, u \models \varphi$

■ iff it is not the case that for some u : $(w, u) \in R(I)$ and $M, u \models \neg \varphi$

■ iff not $M, w \models \langle I \rangle \neg \varphi$

■ iff $M, w \models \neg \langle I \rangle \neg \varphi$

- **Question:** Is a given formula φ true in world w in model M ?
- **Input:** A Kripke model M , a world w in M , and a formula φ .
- **Output:** “Yes” if $M, w \models \varphi$, “No” else.

- $M, w_1 \models \langle toggle \rangle \top \wedge [toggle][toggle]light_on$
 - 1 $M, w_1 \models \langle toggle \rangle \top$
 - 1.1 for some u : $(w_1, u) \in R(toggle)$ and $M, u \models \top$.
 - 1.1.1 we find $(w_1, w_2) \in R(toggle)$ and $M, w_2 \models \top$. 😊
 - 2 $M, w_1 \models [toggle][toggle]light_on$
 - 2.1 for every u : if $(w_1, u) \in R(toggle)$ then $M, u \models [toggle]light_on$
 - 2.1.1 $M, w_2 \models [toggle]light_on$.
 - 2.1.1.1 for every u : if $(w_2, u) \in R(toggle)$ then $M, u \models light_on$
 - 2.1.1.1.1 $M, w_1 \models light_on$. 😊

- A formula φ is **satisfiable in a model** $M = (W, R, V)$, if there exists a world $w \in W$ such that $M, w \models \varphi$.
- A formula φ is **satisfiable in a frame** if it is satisfiable in a model based on that frame.
- A formula φ is **satisfiable in a class of frames** if it is satisfiable in a model based on some frame from the class of frames.
- A formula φ is **true in a model** M ($M \models \varphi$) if φ is true in all worlds of M .

- A formula is **valid in a frame** if φ is true in all models based on that frame.
- We say that a formula φ is **valid in a class of frames \mathbf{C}** (**K**, **T**, **D**, **4**, **5**, and combinations thereof), written $\models_{\mathbf{C}} \varphi$, iff $(W, R, V), w \models \varphi$
 - for every frame (W, R) ,
 - every valuation V over (W, R) ,
 - every world w in W .

A Lattice of Classes

- Valid formulas give us an idea of how the classes differ, and thus what is and is not specific to the **general behavior** of our modalities (Knowledge, Belief, Obligation etc.).
- Correspondences between classes of frames and formulas
 - $\boxed{\text{I}}(\varphi \rightarrow \psi) \rightarrow (\boxed{\text{I}}\varphi \rightarrow \boxed{\text{I}}\psi)$ (for every formulae φ, ψ) is **K**-valid (valid in the class of all frames)
 - $\boxed{\text{I}}\varphi \rightarrow \varphi$ (for every formulae φ) is **T**-valid (exactly valid in the class of reflexive frames)
 - $\boxed{\text{I}}\varphi \rightarrow \langle \text{I} \rangle \varphi$ (for every formulae φ) is **D**-valid (exactly valid in the class of serial frames)
 - $\boxed{\text{I}}\varphi \rightarrow \boxed{\text{I}}\boxed{\text{I}}\varphi$ (for every formulae φ) is **4**-valid (exactly valid in the class of transitive frames)
 - $\langle \text{I} \rangle \varphi \rightarrow \boxed{\text{I}}\langle \text{I} \rangle \varphi$ (for every formulae φ) is **5**-valid (exactly valid in the class of Euclidean frames)

- $\Box(\varphi \rightarrow \psi) \rightarrow (\Box\varphi \rightarrow \Box\psi)$ is **K**-valid:
 - 1 Let M be a arbitrarily chosen Kripke model and w be a arbitrary world in M .
 - 1.1 Assume $M, w \models \Box(\varphi \rightarrow \psi)$ (otherwise the formula is true anyway 😊). Thus, for every world u : if $(w, u) \in R(I)$ then $M, u \models \varphi \rightarrow \psi$.
 - 1.1.1 If $\Box\varphi$ is false in w , then $(\Box\varphi \rightarrow \Box\psi)$ is true in w , and the overall formula is true in w . 😊
 - 1.1.2 If $\Box\varphi$ is true in w , then both $\Box\varphi \rightarrow \psi$ and $\Box(\varphi)$ are true in w . Thus, in every world u accessible from w , also ψ is true, i.e., $\Box(\psi)$ is true in w . Therefore, the overall formula is true in w . 😊

- $\mathbf{[I]}\varphi \rightarrow \varphi$ is not **K**-valid:
 - Consider Kripke model $M = (W, R, V)$ from class **K**:
 - $W = \{w\}$
 - $R(I) = \{\}$
 - $V(p) = \{\}$
 - Check that $M, w \models \mathbf{[I]}p$ and $M, w \not\models p$. Thus, $M, w \not\models \mathbf{[I]}p \rightarrow p$.

- A formula φ **entails** ψ in the class \mathbf{C} (written $\varphi \models_{\mathbf{C}} \psi$) iff for every model M based on some frame in \mathbf{C} and every possible world w of M :
 - if $M, w \models_{\mathbf{C}} \varphi$ then $M, w \models_{\mathbf{C}} \psi$
- Entailment can be reduced to validity:
 - $\varphi \models_{\mathbf{C}} \psi$ iff $\models_{\mathbf{C}} \varphi \rightarrow \psi$
 - $\Theta \models_{\mathbf{C}} \psi$ iff $\models_{\mathbf{C}} \bigwedge \Theta \rightarrow \psi$

- The validity problem can be reduced to the satisfiability problem:
 - Instead of asking whether φ is true in all worlds in all Kripke models in a class, we can ask if $\neg\varphi$ is true in some world in some Kripke model in the class.
- Problem formulation:
 - **Input:** A formula φ .
 - **Output:** “Yes” if there is a Kripke model M and a world w of M such that $M, w \models \varphi$, “No” otherwise.
- It turns out that we can systematically search for Kripke models that satisfy some formula. With this tool at hand, we can algorithmically decide validity.
