Extensions of Arc Consistency

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Enforcing Consistency

- ▶ The more explicit and tight constraint networks are, the more restricted is the search space of partial solutions.
- ▶ Idea: infer at least a limited number of new constraints (by methods called local consistency-enforcing, bounded consistency inference, constraint propagation).
- ▶ Consistency-enforcing algorithms aim at assisting search: How can we extend a given partial solution of a small subnetwork to a partial solution of a larger subnetwork?

Arc Consistency

Convention

In what follows we will always assume that the variables of a constraint network appear in some order. Then we can write constraint networks in the form:

$$C = \langle V, D, C \rangle$$
,

where D_i is the (possibly empty) domain of variable v_i , and constraints in the form R_{ijk} , where $\{v_i, v_i, v_k\}$ is the scope of the relation. Further, we assume that C does not contain unary constraints, i. e.,

constraints in C are always relations with arity n > 1.

This is possible, since we can define:

$$D_i := \operatorname{dom}(v_i) \cap R_{v_i}$$

and then delete R_{v_i} from the original network.

D_i will be referred to as domains, unary constraint, or domain constraint.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Arc Consistency

Let $C = \langle V, D, C \rangle$ be a constraint network.

Definition

- (a) A variable v_i is arc-consistent relative to variable v_i if for every value $a_i \in D_i$ there exists an $a_i \in D_i$ with $(a_i, a_i) \in R_{ii}$ (in case that R_{ii} exists in C).
- (b) An "arc constraint" R_{ii} is arc-consistent if v_i is arc-consistent relative to v_i and v_i is arc-consistent relative to v_i .
- (c) A network C is arc-consistent if all its arc constraints are arc-consistent.

Lemma

Checking whether a network $C = \langle V, D, C \rangle$ is arc-consistent requires $e \cdot k^2$ operations (where e is the number of its binary constraints and k is an upper bound of its domain sizes).

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Arc Consistency

Revising a Single Domains

Revise (v_i, v_i) :

a network with two variables v_i , v_i , Input:

domains D_i and D_i , and constraint R_{ii}

Output: a network with refined D_i such that v_i

is arc-consistent relative to v_i

for each $a_i \in D_i$

if there is no $a_i \in D_i$ with $(a_i, a_i) \in R_{ii}$

then delete a_i from D_i

endif

endfor

This is equivalent to applying:

$$D_i \leftarrow D_i \cap \pi_i(R_{ij} \bowtie D_i)$$

Example

Consider a constraint network with two variables v_1 and v_2 , domains $D_1 = D_2 = \{1, 2, 3\}$, and the binary constraint expressed by $v_1 < v_2$.

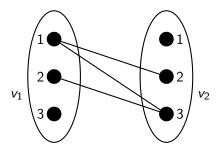

Figure: A network that is not arc-consistent

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

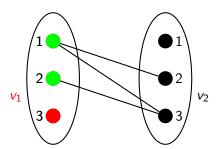

Arc Consistency

Revising a Single Domain

Lemma

The complexity of Revise is $\mathcal{O}(k^2)$, where k is an upper bound of the domain sizes.

Note: With a simple modification of the Revise algorithm one could improve to $\mathcal{O}(t)$, where t is the maximal number of tuples occurring in one of the binary constraints in the network.

Constraint Satisfaction Problems

April 24, 2007

Arc Consistency

AC-1(C):

Input: a constraint network $C = \langle V, D, C \rangle$

Output: an equivalent, but arc-consistent network \mathcal{C}'

repeat

for each arc $\{v_i, v_i\}$ with $R_{ii} \in C$ Revise(v_i, v_i) Revise(v_i, v_i)

endfor

until no domain is changed

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Enforcing Arc Consistency: AC-1

Lemma

Let \mathcal{C} be a constraint network with n variables, each with a domain of size < k, and e binary constraints.

Applying AC-1 on the network runs in time $\mathcal{O}(e \cdot n \cdot k^3)$.

Proof.

One cycle through all binary constraints takes $\mathcal{O}(e \cdot k^2)$. In the worst case, one cycle just removes one value from one domain. Moreover, there are at most $n \cdot k$ values. This result in an upper bound of $\mathcal{O}(e \cdot n \cdot k^3)$.

Note: If the input network is already arc-consistent, then AC-1 runs in time $\mathcal{O}(e \cdot k^2)$.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

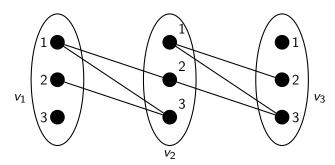

April 24, 2007

10 / 47

Arc Consistency

Example: AC-1

Consider a constraint network with three variables v_1 , v_2 , and v_3 , domains $D_1 = D_2 = \{1, 2, 3\}$, and the binary constraints expressed by $v_1 < v_2$ and $v_2 < v_3$.

Note: Enforcing arc consistency may already be sufficient to show that a constraint network is inconsistent. For example, add the constraint $v_3 < v_1$ to the network just considered.

Arc Consistency

Enforcing Arc Consistency: AC-3

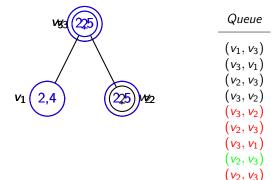

Idea: no need to process all constraints if only a few domains have changed. Hence operate on a queue of constraints that need to be processed.

$AC-3(\mathcal{C})$:

```
Input: a constraint network C = \langle V, D, C \rangle
Output: an equivalent, but arc-consistent network C'
for each pair v_i, v_i that occurs in a constraint R_{ii}
      queue \leftarrow queue \cup \{(v_i, v_i), (v_i, v_i)\}
endfor
while queue is not empty
      select and delete (v_i, v_i) from queue
      Revise(v_i, v_i)
      if Revise(v_i, v_i) changes D_i
           then queue \leftarrow queue \cup \{(v_k, v_i) : k \neq i, k \neq i\}
      endif
endwhile
```

Enforcing Arc Consistency: AC-3

Example: Consider a constraint network with 3 variables v_1 , v_2 , v_3 with domains $D_1 = \{2,4\}$ and $D_2 = D_3 = \{2,5\}$, and two constraints expressed by $v_3|v_1$ and $v_3|v_2$ ("divides").

Constraint Satisfaction Problems

April 24, 2007

 (v_1, v_3)

13 / 47

Arc Consistency

Enforcing Arc Consistency: AC-4

- ▶ To verify that a network is arc-consistent needs $e \cdot k^2$ operations.
- ▶ The following algorithm AC-4 achieves optimal performance, . . .
- ▶ at the cost of "best case performance", which is $\Omega(e \cdot k^2)$.

Idea:

- Associate to each value a_i in the domain of variable v_i the amount of support from variable v_j (i. e., the number of values in D_j that are consistent with a_i);
- \triangleright Delete a value a_i if it has no support from any other variable

Details:

- List: currently unsupported variable-value pairs;
- ightharpoonup counter(x_i, a_i, x_i): support for a_i from x_i ;
- ▶ S_{x_i,a_i} : array pointing to all values in other variables supported by (x_i,a_i) ;
- ▶ M: list of removed values.

Arc Consistency

Enforcing Arc Consistency: AC-3

Lemma

Let C be a constraint network with n variables, each with a domain of size $\leq k$, and e binary constraints.

Applying AC-3 on the network runs in time $\mathcal{O}(e \cdot k^3)$.

Proof.

Consider a single constraint. Each time, when it is reintroduced into the queue, the domain of one of its variables must have been changed. Since there are at most $2 \cdot k$ values, AC-3 processes each constraint at most $2 \cdot k$ times. Because we have e constraints and processing of each is in time $\mathcal{O}(k^2)$, we obtain $\mathcal{O}(e \cdot k^3)$.

Note: If the input network is arc-consistent, then AC-3 runs in time $\mathcal{O}(e \cdot k^2)$.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

14 / 47

Arc Consistency

Enforcing Arc Consistency: AC-4

```
AC-4(C):
```

```
Input: a constraint network C = \langle V, D, C \rangle
Output: an equivalent, but arc-consistent network C'
M \leftarrow \emptyset
initialize S_{x_i,a_i} and counter(x_i,a_i,x_i) for all R_{ij}
for each counter
      if counter(x_i, a_i, x_i) = 0
           then add (x_i, a_i) to List
      endif
endfor
while List is not empty
       choose and remove (x_i, a_i) from List, and add it to M
       for each (x_i, a_i) in S_{x_i, a_i}
           decrement counter(x_i, a_i, x_i)
           if counter(x_i, a_i, x_i) = 0
                then add (x_i, a_i) to List
           endif
      endfor
endwhile
```

16 / 47

Example

Consider the same network as for AC-3.

The initialization steps yield:

$$S_{v_3,2} = \{(v_1, 2), (v_1, 4), (v_2, 2)\}$$
 $S_{v_3,5} = \{(v_2, 5)\}$
 $S_{v_2,2} = \{(v_3, 2)\}$ $S_{v_2,5} = \{(v_3, 5)\}$
 $S_{v_1,2} = \{(v_3, 2)\}$ $S_{v_1,4} = \{(v_3, 2)\}$

Furthermore:

$$counter(v_3, 2, v_1) = 2$$
 and $counter(v_3, 5, v_1) = 0$.

All other counters are 1 (note: we only need consider counters between connected variables).

$$List = \{(v_3, 5)\}$$
 and $M = \emptyset$.

When $(v_3, 5)$ is removed from List and added to M, we obtain $counter(v_2, 5, v_3) = 0$ and add $(v_2, 5)$ to List. Then $(v_2, 5)$ is removed from List and added to M. $(v_2, 5)$ is only supported by $(v_3, 5)$, but that pair is already in M. and we are done.

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Path Consistency

Path Consistency

Definition

- (a) A binary constraint R_{ii} for variables v_i, v_i is path-consistent relative to a third variable v_k if for every pair $(a_i, a_i) \in R_{ii}$, there exists an $a_k \in D_k$ such that $(a_i, a_k) \in R_{ik}$ and $(a_k, a_i) \in R_{ki}$.
- (b) A pair of distinct variables v_i , v_i is path-consistent relative to variable v_k if any instantiation a of $\{v_i, v_i\}$ with $(a(v_i), a(v_i)) \in R_{ii}$ can be extended to an instantiation a' of $\{v_i, v_i, v_k\}$ such that $(a'(v_i), a'(v_k)) \in R_{ik}$ and $(a'(v_k), a'(v_i)) \in R_{ki}$ ("extended" means: $a = a'|_{\{v_i,v_i\}}$).
- (c) A set of distinct variables $\{v_i, v_i, v_k\}$ is path-consistent if any pair of these variables is path-consistent relative to the omitted third variable.
- (d) A constraint network is path-consistent if all its three-element subsets of variables are path-consistent.

Path Consistency

Beyond Arc Consistency

- ▶ Sometimes "enforcing arc consistency" is sufficient for detecting inconsistent (unsolvable) networks; but ...
- enforcing arc consistency is not complete for deciding consistency of networks; because . . .
- ▶ inferences rely only on domain constraints and single binary constraints defined on the domains.
- ⇒ We consider further concepts of local consistency

S. Wölfl, M. Helmert (Universität Freiburg)

Path Consistency

Revising a Path: Properties

Lemma

When applied to a constraint network C, procedure Revise-3($\{v_i, v_i\}, v_k$):

- ▶ does not do anything if the pair v_i , v_j is path-consistent relative to v_k , and otherwise
- ▶ transforms the network into an equivalent form where the pair v_i , v_i is path-consistent relative to v_k .

Proof.

From the definition of path-consistency.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

22 / 47

Path Consistency

Revising a Path: Complexity

Lemma

Let t be the maximal number of tuples in one of the binary constraints, and let k be an upper bound for the domain sizes.

The worst-case runtime of Revise-3 is $O(t \cdot k)$ The best-case runtime of Revise-3 is $\Omega(t)$.

Note that $t \le k^2$, so the complexity of Revise-3 can also be expressed as $\mathcal{O}(k^3)$ in the worst and $\Omega(k^2)$ in the best case.

Path Consistency

Enforcing Path Consistency: PC-1

PC-1(C):

Input: a constraint network $C = \langle V, D, C \rangle$

Output: an equivalent, path-consistent network C'

repeat

for each (ordered) triple of variables v_i, v_j, v_k : Revise-3($\{v_i, v_i\}, v_k$)

Enforcing Path Consistency: Soundness of PC-1

Lemma

When applied to a constraint network C, the PC-1 algorithm computes a path-consistent constraint network which is equivalent to C.

Proof

Follows directly from the properties of Revise-3.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

25 / 47

Path Consistency

Enforcing Path Consistency: Complexity of PC-1

Proof (worst case).

In each iteration of the outer loop in PC-1, only one value pair might be deleted from one of the constraints. Hence the number of iterations may be as large as $\mathcal{O}(n^2 \cdot t)$.

Processing a specific triple of constraints (there are $\mathcal{O}(n^3)$ many such triples) costs $\mathcal{O}(t \cdot k)$.

Hence each iteration costs $\mathcal{O}(n^3 \cdot t \cdot k)$.

Proof (best case).

In the best case, the network is already path-consistent and only one iteration through the outer loop is needed. There are $\Omega(n^3)$ calls to Revise-3, each requiring time $\Omega(t)$ in the best case.

Enforcing Path Consistency: Complexity of PC-1

Lemma

Let C be a constraint network with n variables, each with a domain of size < k. Let t be an upper bound of the number of tuples in one of the binary constraints in C.

The worst-case runtime of PC-1 on this network is $\mathcal{O}(n^5 \cdot t^2 \cdot k)$. The best-case runtime of PC-1 on this network is $\Omega(n^3 \cdot t)$.

Because $t < k^2$, the runtime bounds can also be stated as $\mathcal{O}(n^5 \cdot k^5)$ and $\Omega(n^3 \cdot k^2)$, respectively.

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

26 / 47

Path Consistency

Enforcing Path Consistency: PC-2

PC-2(*C*):

```
Input: a constraint network C = \langle V, D, C \rangle
Output: an equivalent, path-consistent network C'
queue ← {(i, k, j) : 1 < i < j < n, 1 < k < n, k \neq i, k \neq j}
while queue is not empty
      select and delete a triple (i, k, j) from queue
      Revise-3(\{v_i, v_i\}, v_k)
      if R_{ii} has changed then
          queue \leftarrow queue \cup {(I, i, j), (I, j, i) : 1 \le I \le n, I \ne i, j}
      endif
endwhile
```

Enforcing Path Consistency: Soundness of PC-2

Lemma

When applied to a constraint network C, the PC-2 algorithm computes a path-consistent constraint network which is equivalent to C.

Proof

Equivalence follows directly from the properties of Revise-3. To see that the remaining constraint network is path-consistent, verify the following invariant:

Before and after each iteration of the while-loop, for each pair v_i, v_i which is not path-consistent relative to v_k , one of the triples (i, k, j) and (j, k, i) is contained in the gueue.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problem

April 24, 2007

29 / 47

Path Consistency

Enforcing Path Consistency: Complexity of PC-2

Proof (worst case).

There are initially $\mathcal{O}(n^3)$ elements in the gueue. Whenever some constraint R_{ii} is reduced, which can happen at most $\mathcal{O}(n^2 \cdot t)$ many times, O(n) elements are added to the queue. Thus, the total number of elements added to the gueue is bounded by $\mathcal{O}(n^3 \cdot t)$.

Each iteration of the while loop removes an element from the queue, so there are at most $\mathcal{O}(n^3 \cdot t)$ iterations and hence at most $\mathcal{O}(n^3 \cdot t)$ calls to Revise-3, each requiring time $\mathcal{O}(t \cdot k)$, for a total runtime bound of $\mathcal{O}(n^3 \cdot t^2 \cdot k)$.

Proof (best case).

Similar to PC-1.

31 / 47

Enforcing Path Consistency: Complexity of PC-2

Lemma

Let C be a constraint network with n variables, each with a domain of size < k. Let t be an upper bound of the number of tuples in one of the binary constraints in C.

The worst-case runtime of PC-2 on this network is $\mathcal{O}(n^3 \cdot t^2 \cdot k)$. The best-case runtime of PC-2 on this network is $\Omega(n^3 \cdot t)$.

Because $t < k^2$, the runtime bounds can also be stated as $\mathcal{O}(n^3 \cdot k^5)$ and $\Omega(n^3 \cdot k^2)$, respectively.

Path Consistency

Arc and Path Consistency: Overview

	Worst Case	Best Case
AC-1	$\mathcal{O}(n \cdot k \cdot e \cdot t)$	$\Omega(e \cdot k)$
AC-3	$\mathcal{O}(e \cdot k \cdot t)$	$\Omega(e \cdot k)$
AC-4	$\mathcal{O}(e \cdot t)$	$\Omega(e \cdot k^2)$
PC-1	$\mathcal{O}(n^5 \cdot t^2 \cdot k)$	$\Omega(n^3 \cdot t)$
PC-2	$\mathcal{O}(n^3 \cdot t^2 \cdot k)$	$\Omega(n^3 \cdot t)$
PC-4*	$\mathcal{O}(n^3 \cdot t \cdot k)$	$\Omega(n^3 \cdot t \cdot k)$

*not discussed in this lecture

Remark: $\mathcal{O}(n^3 \cdot t \cdot k)$ is the optimal (worst-case) runtime for enforcing path consistency, i.e., there are (arbitrarily large) constraint networks for which no better algorithm exists.

i-Consistency

Higher Levels of *i*-Consistency

The local consistency notions presented so far can be roughly summarized as follows:

- ► Arc consistency: Every consistent assignment to a single variable can be consistently extended to any second variable.
- ▶ Path consistency: Every consistent assignment to two variables can be consistently extended to any third variable.

(Side remark: This is a bit of an oversimplification because we ignored k-ary constraints with $k \ge 3$ so far. More on this later.)

It is easy to see that the general idea of local consistency can be readily extended to larger variable sets.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

33 / 47

i-Consistency

Let $C = \langle V, D, C \rangle$ be a constraint network.

Definition

- (a) A relation $R_S \in C$ with scope S of size i-1 is i-consistent relative to variable $v_i \notin S$ if for every tuple $t \in R_S$, there exists an $a \in D_i$ such that (t, a) is consistent.
- (b) A constraint network is *i*-consistent if any consistent instantiation of i-1 (distinct) variables v_1, \ldots, v_{i-1} of the network can be extended to a *consistent* instantiation of the variables v_1, \ldots, v_i , where v_i is any variable in V distinct from v_1, \ldots, v_{i-1} .

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

34 / 47

i-Consistency

Global Consistency

Definition

- ▶ A network C is strongly *i*-consistent if it is *j*-consistent for each $j \le i$.
- ▶ A network *C* with *n* variables is globally consistent if it is strongly *n*-consistent.

Note: Solutions to globally consistent networks can be found without search. (How?)

i-Consistency

Arc/Path Consistency vs. 2/3-Consistency

Note:

- ▶ 2-consistency coincides with arc consistency.
- ► For networks containing binary constraints only, 3-consistency coincides with path consistency.
- ▶ Each 3-consistent network is path-consistent.
- ► The converse is not true: For networks with constraints of arity ≥ 3, 3-consistency is stricter than path consistency.

3-Consistency: Examples

Example

```
V = \{v_1, v_2, v_3\}
D_1 = D_2 = D_3 = \{0, 1\}
R_{123} = \{(0,0,0)\}
```

Example

$$\begin{split} V &= \{v_1, v_2, v_3\} \\ D_1 &= D_2 = D_3 = \{0, 1\} \\ R_{123} &= \{(0, 0, 0), (0, 1, 1), (1, 0, 1), (1, 1, 0)\} \\ R_{12} &= \{(0, 1), (1, 0), (1, 1)\} \end{split}$$

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007

Revise-i

```
Revise-i(\{v_1, \ldots, v_{i-1}\}, v_i):
```

Input: a network $\langle V, D, C \rangle$ and a constraint R_S

with scope $S = \{v_1, ..., v_{i-1}\}$

i-Consistency

Output: a constraint R_S which is i-consistent rel. to v_i

for each instantiation $\overline{a}_{i-1} \in R_S$ **if** there is no $a_i \in D_i$ such that $(\overline{a}_{i-1}, a_i)$

is consistent **then** delete \overline{a}_{i-1} from R_S

endif

endfor

- \triangleright R_S can be the universal relation wrt. S.
- If the input network is binary, then Revise-i runs in time $\mathcal{O}(ik^i)$.
- ▶ In general, Revise-i runs in time $\mathcal{O}((2 \cdot k)^i)$, since $\mathcal{O}(2^i)$ constraints must be processed for each tuple.

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

April 24, 2007 38 / 47

i-Consistency

i-Consistency: Algorithm

Enforce *i*-Consistency(\mathcal{C}):

Input: A constraint network $C = \langle V, D, C \rangle$. *Output:* An *i*-consistent network equivalent to C.

for each subset of $S \subseteq V$ of size i-1 and each $v_i \notin S$ Revise- $i(\{v_1, ..., v_{i-1}\}, v_i)$

endfor

until no constraint is changed

The Revise-i call can equivalently be stated as follows:

Let S be the set of all subsets of $\{v_1, \ldots, v_i\}$ that contain v_i and occur as scopes of some constraint in the network. Then apply

$$R_S \leftarrow R_S \cap \pi_S(\bowtie_{S' \in S} R_{S'}).$$

i-Consistency

i-Consistency: Complexity

Lemma

Let C be a constraint network with n variables, each with a domain of size < k. When applied to C, the "Enforce i-Consistency" algorithm runs in time $\mathcal{O}(2^i \cdot (n \cdot k)^{2i-1})$.

Proof.

Each call to Revise-i requires time $\mathcal{O}((2 \cdot k)^i)$. In each iteration of the outer loop, $\mathcal{O}(n^i)$ combinations of S and v_i need to be processed. If only one tuple is removed from one constraint in each iteration up to the final one, the outer loop may need to iterate $\mathcal{O}(n^{i-1} \cdot k^{i-1})$ times.

This leads to an overall runtime of $\mathcal{O}(2^i \cdot (n \cdot k)^{2i-1})$.

Note: Improvements similar to AC-4 and PC-4 exist and achieve a worst-case runtime of $\mathcal{O}(n^i \cdot k^i)$.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

AC Extensions

Generalized Arc Consistency

Let $C = \langle V, D, C \rangle$ be a constraint network.

Definition

- (a) A variable v_i is (generalized) arc-consistent relative to a constraint $R \in C$ whose scope contains v_i if for every value $a_i \in D_i$ there exists a tuple $\bar{a} \in R$ with $\bar{a}_i = a_i$.
- (b) A constraint $R \in C$ is (generalized) arc-consistent iff all variables in its scope are generalized arc-consistent relative to R.
- (c) A network $\mathcal C$ is (generalized) arc-consistent if all its constraints are generalized arc-consistent.

Extensions of Arc Consistency

- ▶ General *i*-consistency is powerful, but expensive to enforce.
- ▶ Usually, arc consistency and path consistency offer a good compromise between pruning power and computational overhead.
- ► However, they are of limited usefulness for constraints on more than two variables.

Example

Consider a constraint network with three integer variables $v_1, v_2, v_3 \ge 0$ and the constraints $v_3 \ge 13$ and $v_1 + v_2 + v_3 \le 15$.

We should be able to infer $v_1 \le 2$ and $v_2 \le 2$, but regular arc consistency is not enough!

→ Consider generalizations of arc consistency to non-binary constraints.

AC Extensions

Generalized Arc Consistency: Update Rule

To enforce generalized arc consistency, repeatedly apply

$$D_i \leftarrow D_i \cap \pi_i(R_S \bowtie D_{S\setminus \{v_i\}})$$

Note how this generalizes the usual arc consistency update rule:

$$D_i \leftarrow D_i \cap \pi_i(R_{ij} \bowtie D_j)$$

AC Extensions

Alternatives to Generalized Arc Consistency

- ► Like arc consistency, generalized arc consistency propagates constraints by considering a single constraint at a time.
- ▶ In particular, it considers how assignments to each individual variable are restricted by the values allowed for the other variables participating in the constraint.
- ► Alternatively, we can consider how each individual variable restricts the values allowed for the other variables participating in the constraint:

$$R_{S\setminus\{v_i\}} \leftarrow R_{S\setminus\{v_i\}} \cap \pi_{S\setminus\{v_i\}}(R_S \bowtie D_i)$$

(relational arc consistency)

▶ Note that in the case of binary constraints, these two cases are the same, so both approaches are natural generalizations of (binary) arc consistency.

AC Extensions

Generalizations of Arc Consistency: Comparison

$$\begin{aligned} &\mathsf{AC}\colon D_i \leftarrow D_i \cap \pi_i (R_{ij} \bowtie D_j) \\ &\mathsf{generalized} \ &\mathsf{AC}\colon D_i \leftarrow D_i \cap \pi_i (R_S \bowtie D_{S\setminus \{v_i\}}) \\ &\mathsf{relational} \ &\mathsf{AC}\colon R_{S\setminus \{v_i\}} \leftarrow R_{S\setminus \{v_i\}} \cap \pi_{S\setminus \{v_i\}} (R_S \bowtie D_i) \end{aligned}$$

Example

Consider a constraint network with three integer variables $v_1, v_2, v_3 \ge 0$ and the constraints $v_3 \ge 13$ and $v_1 + v_2 + v_3 \le 15$.

- ▶ Generalized AC infers $v_1 \le 2$, $v_2 \le 2$.
- ▶ Relational AC infers $v_1 + v_2 < 2$.
