Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Expressiveness vs. Complexity

- ▶ For some restricted constraint languages we know some polynomial time algorithms that solve each instance of that language
- ▶ Restricting constraint languages entails restricting expressiveness, i. e., the class of problems that can be expressed in the language
- → How can we weight expressiveness against performance and vice versa?

CSP Instances aka Constraint Networks

Definition

An instance of a constraint satisfaction problem (i. e., a constraint network) is a triple

$$P = \langle V, D, C \rangle$$
,

where:

- ▶ V is a non-empty and finite set of variables,
- ► D is an arbitrary set (domain),
- \triangleright C is a finite set of constraints C_1, \ldots, C_q , i. e., each constraint C_i is a pair (s_i, R_i) , where s_i is a tuple of variables of length m_i and R_i is an m_i -ary relation on D

(s_i : constraint scope; R_i : constraint relation).

June 19/21/26/28, July 3, 2007

Restricting the General CSP

The general CSP search problem is the following: Given an instance of a constraint satisfaction problem, P, determine if there exists solution to P, i. e., determine whether

$$\mathsf{Sol}(P)$$
 := $\big\{(d_1,\ldots,d_n)\in D^n\,:\, a(v_i)=d_i \text{ for a solution } a\text{ of } P\big\}$

(where n is the number of variables of V) is not empty.

Restricting the general CSP:

- ▶ structural restriction: consider just CSP instances with particular constraint scopes (e.g., where the network hypergraph has specific properties)
- ► relational restriction: consider just CSP instances, where the constraint relations have a specific form or specific properties

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

5 55

Tractable Constraint Languages

Example: the CHIP language

CHIP is a constraint language for arithmetic and other constraints. Basic constraints in CHIP are so-called:

- domain constraints: unary constraints that restrict the domains of variables to a finite set of natural numbers
- ▶ arithmetic constraints: constraints of one of the forms

$$ax = by + c$$

 $ax \le by + c$
 $ax > by + c$

 $(a,b,c\in\mathbb{N},a\neq0)$. If these equations are conceived of as relations, the resulting constraint language is tractable.

The language is still tractable if we allow for relations expressed by

$$a_1x_1 + a_2x_2 + \dots + a_nx_n \ge by + c$$

$$ax_1 \dots x_n \ge by + c$$

$$(a_1x_1 \ge b_1) \vee \dots \vee (a_nx_n \ge b_n) \vee (ay \ge b)$$

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Constraint Language

Definition

A constraint language is an arbitrary set of relations, Γ , defined over some fixed domain (denoted by $D(\Gamma)$).

Definition

For a constraint language Γ , let \mathbf{C}_{Γ} be the class of CSP instances $P = \langle V, D, C \rangle$ such that for each $(s, R) \in C$, $R \in \Gamma$. \mathbf{C}_{Γ} is referred to as the relational subclass associated with Γ .

c is referred to as the relational subclass associated with r

Definition

A finite constraint language Γ is tractable if there exists a polynomial algorithm that solves all instances of \mathbf{C}_{Γ} .

An infinite constraint language Γ is tractable if each finite subset of the language is tractable.

Following, we present some examples:

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

55

Tractable Constraint Languages

Example: Linear Equations

Let D be any field (e.g., the field of real numbers).

A linear relation on D is any relation defined by a linear equation

$$a_1x_1+\cdots+a_nx_n=r$$
 $(a_1,\ldots,a_n,r\in D).$

Constraint Satisfaction Problems

The language of all linear relations over ${\it D}$ is tractable (apply Gaussian elimination).

Example: Relations on Ordered Finite Sets

Let D be an ordered and finite set.

Consider the binary disequality relation

$$\neq_D = \{(d_1, d_2) \in D^2 : d_1 \neq d_2\}$$

The class of CSP instances $\mathbf{C}_{\{\neq_D\}}$ corresponds to the graph colorability problem with |D| colors.

 $\mathbf{C}_{\{\neq_D\}}$ is tractable if $|D| \leq 2$, and intractable, otherwise.

The ternary betweenness relation over *D* is defined by:

$$B_D = \{(a, b, c) \in D^3 : a < b < c \lor c < b < a\}$$

 \mathbf{C}_{B_D} is tractable if $|D| \leq 4$, and intractable if $|D| \geq 5$.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Tractable Constraint Languages

Example: Boolean Constraints

Let $D = \{d_0, d_1\}.$

The class of CSP instances \mathbf{C}_{N_D} , where

$$N_D = D^3 \setminus \{(d_0, d_0, d_0), (d_1, d_1, d_1)\}$$

is the not-all-equal relation over D, is intractable.

 \mathbf{C}_{N_D} corresponds to the not-all-equal satisfiability problem (NAE-3SAT), which is known to be NP-hard.

The class of CSP instances \mathbf{C}_{T_D} , where

$$T_D = \{(d_0, d_0, d_1), (d_0, d_1, d_0), (d_1, d_0, d_0)\}$$

is intractable.

 \mathbf{C}_{N_D} corresponds to the one-in-three satisfiability problem (1-in-3 SAT).

Tractable Constraint Languages

Example: Connected Row-Convex Relations

Let $D = \{d_1, \ldots, d_n\}$ be an ordered and finite set.

For a binary relation R over D, the matrix representation of R is an $n \times n$ 0,1-matrix M, where $M_{ii} = 1$ iff $(d_i, d_i) \in R$.

The pruned matrix representation of R results from the matrix representation of R, when we remove all rows and columns in which only 0's occur.

R is connected row-convex, if in the pruned matrix representation of R, the pattern of 1's is connected along each column, along each row, and forms a connected 2-dimensional region.

For example,

$$\left(\begin{array}{ccccc} 0 & 1 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 & 1 \\ 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \end{array}\right) \qquad \left(\begin{array}{ccccccc} 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{array}\right)$$

The constraint language on any class of connected row-convex relations is tractable.

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problem

June 19/21/26/28, July 3, 2007

Tractable Constraint Languages

Example: 0/1/all-Relations

Let D be an arbitrary finite set. A relation R over D is called 0/1/all-relation if one of the following conditions holds:

- ► *R* is unary;
- $ightharpoonup R = D_1 \times D_2$ for subsets D_1 , D_2 of D:
- $ightharpoonup R = \{(d, \pi(d)) : d \in D_1\}, \text{ for some subset } D_1 \subseteq D \text{ and some }$ permutation π of D_1 :
- ▶ $R = \{(a, b) \in D_1 \times D_2 : a = d_1 \lor b = d_2\}$, for some subsets D_1, D_2 of D and some elements $d_1 \in D_1, d_2 \in D_2$.

The language defined by all 0/1/all-relations is tractable.

(It is even maximal tractable in the sense that if we add any binary relation over D that is not a 0/1/all-relation, then the resulting constraint language becomes intractable).

max-Closed Relations

Let (D, <) be a linear order. Define max : $D \times D \rightarrow D$ in the usual way. i. e., max(a, b) = a if a > b, and max(a, b) = b, otherwise.

We extend max to a function that can be applied to tuples, i.e., we define $\max: D^k \times D^k \to D^k$ by

$$\max((a_1,\ldots,a_k),(b_1,\ldots,b_k))$$

:= $(\max(a_1,b_1),\ldots,\max(a_k,b_k)).$

Definition

An *n*-ary relation R over D is max-closed if for all (a_1, \ldots, a_n) . $(b_1,\ldots,b_n)\in R$,

$$\max((a_1,\ldots,a_n),(b_1,\ldots,b_n))\in R.$$

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Tractable Constraint Languages

Example: max-Closed Relations

Consider the CHIP language. All relations of CHIP are max-closed. Hence any set of equations can be solved by establishing arc-consistency.

For example, consider a CSP instance with domain $\{1, \ldots, 5\}$, variables $\{v, w, x, y, z\}$, and equations

$$w \neq 3, z \neq 5, 3v \leq z, y \geq z + 2,$$

$$3x + y + z \ge 5w + 1, \quad wz \ge 2y.$$

Enforcing arc-consistency results in:

$$D(v) = \{1\}, \ D(w) = \{4\}, \ D(x) = \{3,4,5\},$$

$$D(v) = \{5\}, \ D(z) = \{3\}.$$

Hence

$$v \mapsto 1, w \mapsto 4, x \mapsto 5, y \mapsto 5, z \mapsto 3$$

is a solution of the constraint network.

Tractable Constraint Languages

max-Closed Relations and Tractability

Lemma

Let Γ be a constraint language with max-closed relations only. Then \mathbf{C}_{Γ} is tractable.

Proof.

Enforce generalized arc-consistency. If any domain of the resulting network is empty, the network is inconsistent. Otherwise, set each variable to its maximal value.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problem

June 19/21/26/28, July 3, 2007

Schaefer's Dichotomy Theorem

Boolean Constraint Languages

The key result in the literature on tractable constraint languages is Schaefer's Dichotomy Theorem (1978).

Definition

A Boolean constraint language is a constraint language over the two-element domain $D = \{0, 1\}$.

Schaefer's theorem states that any Boolean constraint language is either tractable or NP-complete. Moreover, it provides a classification of all tractable constraint languages.

Definition

An arbitrary constraint language Γ is NP-complete if \mathbf{C}_{Δ} is NP-complete for some finite subset $\Delta \subseteq \Gamma$.

Schaefer's Theorem

Theorem (Schaefer 1978)

Let Γ be a Boolean constraint language. Then Γ is tractable if at least one of the following conditions is satisfied:

- 1. Each relation in Γ contains the tuple $(0, \ldots, 0)$.
- 2. Each relation in Γ contains the tuple $(1, \ldots, 1)$.
- 3. Each relation in Γ is definable by a formula in CNF s. t. each conjunct has at most one negative literal.
- 4. Each relation in Γ is definable by a formula in CNF s. t. each conjunct has at most one positive literal.
- 5. Each relation in Γ is definable by a formula in CNF s. t. each conjunct has at most two literals.
- 6. Each relation in Γ is the set of solutions of a system of linear equations over the finite field with 2 elements.

In all other cases, Γ is NP-complete.

Relational Clones

Gadgets

Definition

Let Γ be constraint language and R be a relation on $\Gamma(D)$.

R is expressible in Γ if there exists a CSP instance $P \in \mathbf{C}_{\Gamma}$ and a sequence of variables v_1, \ldots, v_n such that

$$R = \pi_{v_1,\ldots,v_n}(\mathsf{Sol}(P)).$$

P is referred to as a gadget for expressing R in C_{Γ} , the sequence v_1, \ldots, v_n as construction site for R.

Algorithm Selector

Let Γ be a Boolean constraint language.

- Class 1: any CSP instance P can be solved by simply assigning 0 to each variable of P.
- Class 2: cf. Class 1 ($v \mapsto 1$).
- Class 6: any CSP instance P can be solved by applying the Gaussian elimination procedure.
- Class 5: any CSP instance P can be solved by resolution: in this case \mathbf{C}_{Γ} corresponds to the 2-SAT satisfiability problem and this can be solved efficiently by resolution.
- Class 4: any CSP instance P can be solved by unit resolution: here \mathbf{C}_{Γ} corresponds to the Horn-SAT satisfiability problem, which can be solved efficiently by unit resolution.
- Class 3: cf. Class 4 ("anti-Horn").

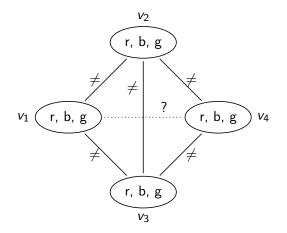

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problem

June 19/21/26/28, July 3, 2007

Relational Clones

Example

Which relation is expressed by the edge (v_1, v_4) ?

- ▶ relations from $\Gamma \cup \{=_D\}$,
- conjunctions, and
- existential quantification.

(Formulae of this form are called primitive positive formulae.)

Definition

Let Γ be a constraint language. $\langle \Gamma \rangle$ denotes the smallest relational clone containing Γ , the clone generated by Γ .

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Reducibility I

Theorem

Let Γ be a set of relations on a fixed domain D, and let Δ be a finite subset of $\langle \Gamma \rangle$. Then there exists a polynomial time reduction from \mathbf{C}_{Λ} to \mathbf{C}_{Γ} .

Proof

Let $\Delta = \{S_1, \dots, S_k\}$ be a finite set of relations, where each S_i is expressible by a pp-formula with relations from Γ and the relation $=_D$. For each S_i fix such a formula $\phi_i(x_1,\ldots,x_{r_i})$, where r_i is the arity of S_i . Without loss of generality, we may assume that each $\phi_i(x_1,\ldots,x_{r_i})$ has the form

$$\exists u_1 \dots u_m(R_1(w_1^1, \dots, w_{k_1}^1) \wedge \dots \wedge R_n(w_1^n, \dots, w_{k_n}^n))$$
 (1)

where $w_1^1,\ldots,w_{k_1}^1,\ldots,w_1^n,\ldots,w_{k_n}^n\in\{x_1,\ldots,x_{r_j},u_1,\ldots,u_m\}$ for some auxiliary variables u_1, \ldots, u_m , and $R_1, \ldots, R_n \in \Gamma \cup \{=_D\}$

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Example

Consider a Boolean constraint language with the following relations:

$$R_1 = \{(0,1), (1,0), (1,1)\}$$
 $R_2 = \{(0,0), (0,1), (1,0)\}.$

The relational clone generated by the set of these two relations contains all 16 binary Boolean relations. For example:

$$R_{3} := \{(0,1),(1,0)\} \qquad R_{1}(v_{1},v_{2}) \land R_{2}(v_{1},v_{2})$$

$$R_{4} := \{(0,0),(1,0),(1,1)\} \qquad \exists y (R_{1}(v_{1},y) \land R_{2}(y,v_{2}))$$

$$R_{5} := \{(0,0),(1,1)\} \qquad v_{1} = v_{2}$$

$$R_{6} := \{(0,0)\} \qquad R_{2}(v_{1},v_{2}) \land R_{5}(v_{1},v_{2})$$

$$R_{7} := \{(1,1)\} \qquad R_{1}(v_{1},v_{2}) \land R_{5}(v_{1},v_{2})$$

$$R_{8} := \{(0,1)\} \qquad \exists y (R_{6}(v_{1},y) \land R_{1}(y,v_{2}))$$

$$\dots$$

Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problem

June 19/21/26/28, July 3, 2007

Relational Clones

Reducibility II

Let $P = \langle V, D, C \rangle$ be an arbitrary instance in \mathbf{C}_{Δ} . Initially, set V':=V,D':=D,C':=C. For each constraint (s,R) (where $s=(v_1,\ldots,v_r)$) of P, proceed as follows:

- 1. add the auxiliary variables u_1, \ldots, u_m to V' (always add new variables, rename variables if necessary (also in (1)))
- 2. remove (r, R) from C' and instead add to C' the constraints (cf. (1)):

$$((w_1^1,\ldots,w_{k_1}^1),R_1),\ldots,(w_1^n,\ldots,w_{k_n}^n,R_n)$$

The CSP instance P' obtained by this procedure is contained in $\mathbf{C}_{\Gamma \cup \{=_D\}}$ and is obviously equivalent to P. Furthermore, from P' we can obtain a \overrightarrow{CSP} instance P'' in \mathbf{C}_{Γ} by deleting constraints of the form $((v_i, v_i), =_D)$ and replacing any occurrence of v_i by v_i . Obviously, both transformation can be done in polynomial time.

Corollary

A constraint language Γ is tractable if and only if its relational clone $\langle \Gamma \rangle$ is tractable. Γ is NP-complete if and only if $\langle \Gamma \rangle$ is NP-complete.

Corollary

Let Γ be a constraint language and let R be a relation. *R* is expressible in Γ if and only if $R \in \langle \Gamma \rangle$.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Relational Clones

Example: \neg , \oplus

Consider the Boolean constraint language containing the unary relation \neg and the exclusive-or relation \oplus , i. e.,

$$R_{\oplus} = \{(0,1), (1,0)\}$$
 and $R_{\neg} = \{(0)\}.$

The 3-rd order indicator problem of this language is:

June 19/21/26/28, July 3, 2007

Relational Clones

The Indicator Problem

Let k > 1 be a fixed natural number.

Let $s = (x_1, \dots, x_m)$ be a list of k-tuples in D^k .

Let R be an n-ary relation on D.

We say, that s matches R if n = m and if for each 1 < i < k, the n-tuple $(x_1[i],\ldots,x_n[i])$ is in R.

Let now Γ be a fixed constraint language. Set $I_k(\Gamma) = \langle V, D, C \rangle$, where

$$V := D^k$$

$$C := \{(s, R) : s \text{ matches } R\}$$

Note: $I_k(\Gamma) \in \mathbf{C}_{\Gamma}$ and contains constraints from Γ on every possible scope which matches some relation in Γ .

Definition

 $I_k(\Gamma)$ is said to be the indicator problem of order k for Γ .

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Expressiveness and the Indicator Problem

Theorem (Jeavons (1998))

Let Γ be a constraint language over some finite domain D and let $R = \{t_1, \dots, t_k\}$ be any n-ary relation on D. Equivalent are:

- (a) R is expressible in Γ (i. e., $R \in \langle \Gamma \rangle$).
- (b) $I_k(\Gamma)$ is a gadget for expressing R with construction site (v_1, \ldots, v_n) , where for each 1 < i < n,

$$v_i := (t_1[i], \ldots, t_k[i]).$$

Proof.

The direction from (b) to (a) is trivial, since $I_k(\Gamma)$ is contained in \mathbf{C}_{Γ} . The other direction will be proved later.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

29 55

Polymorphisms

Polymorphisms

Let f be a k-ary operation, i.e., a function $f:D^k\to D$. For any collection of n-tuples, $t_1,\ldots,t_k\in D^n$, let $f(t_1,\ldots,t_k)$ be defined as the n-tuple:

$$(f(t_1[1],\ldots,t_k[1]),\ldots,f(t_1[n],\ldots,t_k[n]))$$

Definition

Let $f: D^k \to D$ be a k-ary operation, and R be an n-ary relation. f is a polymorphism of R (or: R is invariant under f) if for all $t_1, \ldots, t_k \in R$, $f(t_1, \ldots, t_k) \in R$.

Expressiveness

Example: \neg , \oplus

Problem: Is the implication expressible in the Boolean language $\{\neg, \oplus\}?$

Consider the 3rd indicator problem (since R_{\Rightarrow} has three elements (1,1),(0,1),(0,0)). Consider the variables v=(1,0,0) and w=(1,0,1):

1	1	1	1	0	0	0	0
1	1	0	0	1	1	0	0
1	0	1	1 0 0	1	0	1	0

Solutions									
1	0	1	1	0	0	1	0		
1	0	1	0	1	0	1	0		
1	0	0	1	0	1	1	0		
1	0	0	0	1	1	1	0		
1	1	1	1	0	0	0	0		
1	1	1	0	1	0	0	0		
1	1	0	1	0	1	0	0		
1	1	0	0	1	1	0	0		

From this we obtain that $\pi_{(v,w)}(I_3(\Gamma)) = D \times D \neq R_{\Rightarrow}$.

Thus, the implication is not expressible.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Polymorphisms

Polymorphisms and Invariant Relations

Let Γ be a set of relations on a fixed domain D, and let F be a set of operations on D. Then define:

Pol(Γ): the set of operations on D that preserve each relation in Γ

Inv(F): the set of relations on D that are invariant under each operation of F

Lemma

Pol and Inv define anti-monotone functions, and are related by the following Galois connection:

$$\Gamma \subseteq \operatorname{Inv}(F) \iff F \subseteq \operatorname{Pol}(\Gamma)$$

In particular, it holds:

$$\Gamma \subset Inv(Pol(\Gamma))$$
 and $F \subset Pol(Inv(F))$.

The Indicator Problem and Polymorphisms

Lemma

Let Γ be a constraint language. The solutions of the k-th indicator problem $I_k(\Gamma)$ are precisely the k-ary polymorphisms of Γ .

Proof

Apply the definitions . . .

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Expressiveness and the Indicator Problem (Part 2)

The following lemma completes the proof of Jeavons' theorem:

Lemma

Let $R = \{t_1, \dots, t_k\}$ be an n-ary relation (over some finite domain D). For $1 \le i \le n$, set $v_i := (t_1[i], ..., t_k[i])$. If R is expressible in Γ , then $R = \pi_{v_1,...,v_n}(Sol(I_k(\Gamma)))$.

Proof.

Blackboard.

S. Wölfl, M. Helmert (Universität Freiburg)

June 19/21/26/28, July 3, 2007

Expressiveness and Polymorphisms

Lemma

Let Γ be a constraint language over some domain D. If $f: D^k \to D$ is a polymorphism of each $R \in \Gamma$, then f is a polymorphism of each $R \in \langle \Gamma \rangle$.

Proof.

Induction on primitive positive formula (cf. blackboard).

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Expressiveness and Invariants

Theorem

For any constraint language Γ over some finite domain D,

$$\langle \Gamma \rangle = Inv(Pol(\Gamma))$$

Proof.

 \subseteq is clear. For the converse let R be an n-ary relation that is invariant for each polymorphism of Γ . We have to show that $R \in \langle \Gamma \rangle$. Let $R = \{t_1, \dots, t_k\}$ and consider the k-th indicator problem of Γ . First define $v_i := (t_1[i], \dots, t_k[i])$ $(1 \le i \le n)$, then consider $R_t = \pi_{v_1, \dots, v_n}(Sol(I_k(\Gamma)))$. By one of the lemmas above, R is expressible if $R = R_t$.

 $R_t \subseteq R$ follows from the facts that every solution of $I_k(\Gamma)$ is a k-ary polymorphism and that each polymorphism of Γ preserves R. For $R \subseteq R_t$, consider t_i in R. Now the j-th projection function $p_i: D^k \to D$ is a polymorphism. Hence $t_i = p_i(t_1, \dots, t_k) \in R$.

Corollary

Let Γ and Δ be a constraint languages on a finite domain. If Δ is finite and $Pol(\Gamma) \subseteq Pol(\Delta)$, then \mathbf{C}_{Δ} is polynomial-time reducible to \mathbf{C}_{Γ} .

Operations (cont'd)

Definition

- ▶ Given k = 2, f is a semi-lattice operation, if it is
 - associative (i. e., f(x, f(y, z)) = f(f(x, y), z)),
 - ightharpoonup commutative (i. e., f(x, y) = f(y, x)), and
 - ▶ idempotent.
- \blacktriangleright Given k=3 and an Abelian group structure on D, f is affine, if for all $x, y, z \in D$,

$$f(x,y,z)=x-y+z.$$

• Given k > 3, f is a near-unanimity operation, if for all $x, y \in D$,

$$f(y,x,\ldots,x)=f(x,y,x\ldots,x)=\cdots=f(x,\ldots,x,y)=x.$$

Operations

Following, we study k-ary operations $f: D^k \to D$.

Definition

- ▶ f is idempotent, if for each $x \in D$, f(x,...,x) = x.
- Given k = 3, f is a majority operation, if for all $x, y \in D$,

$$f(x, x, y) = f(x, y, x) = f(y, x, x) = x.$$

▶ Given k = 3, f is a Mal'tsev operation, if for all $x, y \in D$,

$$f(y,y,x)=f(x,y,y)=x.$$

• f is conservative, if for all $x_1, \ldots, x_k \in D$,

$$f(x_1,\ldots,x_k)\in\{x_1,\ldots,x_k\}.$$

Tractability over Finite Domains

Operations (cont'd)

Definition

ightharpoonup f is essentially unary, if there exists an 1 < i < k and a unary non-constant operation g on D such that for all $x_1, \ldots, x_k \in D$,

$$f(x_1,\ldots,x_k)=g(x_i).$$

If g is the identity operation, then f is called a projection.

• Given k > 3, f is a semi-projection if f is not an projection and there exists an 1 < i < k, such that for all $x_1, \ldots, x_k \in D$ with $|\{x_1,\ldots,x_k\}| < k,$

$$f(x_1,\ldots,x_k)=x_i.$$

A Necessary Condition for Tractability

Theorem

Given $P \neq NP$, any tractable constraint language Γ over a finite domain has a solution to an indicator problem $I_k(\Gamma)$ that defines

- ► a constant operation,
- ► a majority operation,
- ▶ an idempotent binary operation,
- ► an affine operation, or
- ▶ a semi-projection.

41 55 Boolean CSPs

The complexity of any language over a domain of size 2 can be determined by considering the solutions of its 3rd order indicator problem. The problem is intractable unless this indicator problem has one of the following six solutions:

Variables										
1	1	1	1	0	0	0	0			
1	1	0	0	1	1	0	0			
_1	0	1	0	1	0	1	0			

Tractability over Finite Domains

Tractability over Finite Domains

Sufficient Conditions: Semi-Lattice Operations

In what follows let Γ be always be a constraint language over a finite domain D. We present some sufficient criteria for (in-) tractability.

Theorem

If $Pol(\Gamma)$ contains a semi-lattice operation, then

- ▶ Γ is tractable, and
- \blacktriangleright each instance of \mathbf{C}_{Γ} can be solved by enforcing generalized arc-consistency.

Examples

Example 1:

If Γ is the Boolean constraint language containing all relations expressible by conjunctions of Horn clauses, then

$$\wedge:\{0,1\}^2\rightarrow\{0,1\}$$

is a semi-lattice operation that is a polymorphism of Γ .

Example 2:

If D is ordered, then max is a semi-lattice operation, which is a polymorphism of each set of max-closed relations.

Tractability over Finite Domains

Sufficient Conditions: Near-Unanimity Operations

Theorem

If $Pol(\Gamma)$ contains a k-ary near-unanimity operation, then

- Γ is tractable.
- ▶ Each instance of C_{Γ} can be solved by enforcing strong k-consistency.

Proof.

Blackboard.

Tractability over Finite Domains

Sufficient Conditions: Conservative Operations

Theorem

If $Pol(\Gamma)$ contains a conservative and commutative operation, then Γ is tractable.

Note: If Γ contains all unary relations on D, then all operations in Pol(Γ) are conservative.

S. Wölfl, M. Helmert (Universität Freiburg)

Constraint Satisfaction Problems

June 19/21/26/28, July 3, 2007

Tractability over Finite Domains

Examples

Example 3:

Let Γ be the Boolean constraint language that consists of all relations definable by a PL-formula in CNF s.t. each conjunct has at most two literals.

Then

$$d(x,y,z) := (x \wedge y) \vee (y \wedge z) \vee (x \wedge z)$$

is a near-unanimity operation on $\{0,1\}$ and a polym. of Γ .

Example 4:

The 0/1/all relations are invariant under the ternary operation

$$d(x, y, z) := \begin{cases} x & \text{if } y \neq z \\ y & \text{else} \end{cases}$$

which is a near-unanimity operation.

Sufficient Conditions: Mal'tsev Operations

Theorem

If $Pol(\Gamma)$ contains a k-ary Mal'tsev operation, then \mathbf{C}_{Γ} is tractable.

Note: Affine relations are Mal'tsev operations.

S. Wölfl, M. Helmert (Universität Freiburg)

Tractability over Finite Domains

A Sufficient Condition for Intractability

Theorem

Let Γ be a constraint language over a finite domain. If $Pol(\Gamma)$ contains only essentially unary operations, then \mathbf{C}_{Γ} is NP-complete.

Proof idea:

We can assume that Γ is reduced. One can show that

- $\blacktriangleright \neq_D$ is in Inv(Pol(Γ));
- if |D| = 2, $Inv(Pol(\Gamma))$ contains the not-all-equal relation:

$$D^3 \setminus \{(x,x,x) : x \in D\}$$

which ensures that \mathbf{C}_{Γ} intractable.

Tractability over Finite Domains

Reduced Constraint Languages

Lemma

Let Γ be a constraint language over D, and let f be a unary operation on Pol(Γ). Let $f(\Gamma)$ be the set of all $f(R) := \{f(t) : t \in R\}$ with $R \in \Gamma$. Then, \mathbf{C}_{Γ} is polynomial-time equivalent to $\mathbf{C}_{f(\Gamma)}$.

Definition

A constraint language Γ is reduced if all its unary polymorphisms are surjective.

Note: Each constraint language can be transformed into a reduced language. For this find all unary polymorphisms by generating and solving the 1st order indicator problem. Choose one of these polymorphisms f with a minimal number of values in its range.

June 19/21/26/28, July 3, 2007

Tractability over Finite Domains

Towards a Classification

It can be shown that for any reduced constraint language Γ on a finite domain D, one of the following conditions holds:

- Pol(Γ) contains a constant operation;
- \triangleright Pol(Γ) contains a ternary near-unanimity operation;
- Pol(Γ) contains a Mal'tsev operation;
- \triangleright Pol(Γ) contains an idempotent binary operation;
- ► Pol(Γ) contains a semi-projection;
- \triangleright Pol(Γ) contains essentially unary operations only.

Maximal Tractable Constraint Languages

Maximal and Maximal Tractable Languages

Definition

- \triangleright A constraint language Γ is maximal tractable, if it is tractable and for each relation $R \notin \Gamma$, $\Gamma \cup \{R\}$ is intractable.
- ▶ A constraint language Γ is maximal, if there is a relation $R \notin \langle \Gamma \rangle$ and each proper extension of $\langle \Gamma \rangle$ contains all relations on D.

Note: If Γ is a maximal language that is tractable, then $\langle \Gamma \rangle$ is maximal tractable.

Maximal Tractable Constraint Languages

Maximality vs. Tractability

Theorem

Let Γ be a constraint language on some finite domain D, and let f be a *k*-ary operation such that $\langle \Gamma \rangle = \text{Inv}(\{f\})$.

Then $\langle \Gamma \rangle$ is maximal tractable, if

- ▶ f is a constant operation;
- ▶ f is a ternary near-unanimity operation;
- ▶ f is a semi-lattice operation;
- ▶ f is an affine operation.
