Qualitative Temporal Representation and Reasoning

Often we do not want to talk about precise times:

- NLP - we do not have precise time points
- Planning - we do not want to commit to time points too early
- Scenario descriptions - we do not have the exact times or do not want to state them

What are the primitives in our representation system?

- Time points: actions and events are instantaneous, or we consider their beginning and ending
- Time intervals: actions and events have duration
- Reducibility? Expressiveness? Computational costs for reasoning?

Allen's Interval Calculus Motivation

## Motivation: Example

Consider a planning scenario for multimedia generation:
P1: Display Picture1
P2: Say "Put the plug in."
P3: Say "The device should be shut off."
P4: Point to Plug-in-Picture1.
Temporal relations between events:

| P2 | should happen during | P1 |
| :---: | :---: | :---: |
| P3 | should happen during | P1 |
| P2 | should happen before or directly precede | P3 |
| P4 | should happen during or end together with | P2 |

$\rightsquigarrow$ P4 happens before or directly precedes P3
$\rightsquigarrow$ We could add the statement "P4 does not overlap with P3" without creating an inconsistency.

## Allen's Interval Calculus

- Allen's interval calculus: time intervals and binary relations over them
- Time intervals: $X=\left(X^{-}, X^{+}\right)$, where $X^{-}$and $X^{+}$are interpreted over the reals and $X^{-}<X^{+}(\rightsquigarrow$ naïve approach $)$
- Relations between concrete intervals, e.g.:
$(1.0,2.0)$ strictly before $(3.0,5.5)$
$(1.0,3.0)$ meets $(3.0,5.5)$
$(1.0,4.0)$ overlaps $(3.0,5.5)$
$\rightsquigarrow$ Which relations are conceivable?
Allen's Interval Calculus Intervals and Relations Between Them

## The Base Relations

How many ways are there to order the four points of two intervals?

| Relation | Symbol | Name |
| :---: | :---: | :--- |
| $\left\{(X, Y): X^{-}<X^{+}<Y^{-}<Y^{+}\right\}$ | $\prec$ | before |
| $\left\{(X, Y): X^{-}<X^{+}=Y^{-}<Y^{+}\right\}$ | m | meets |
| $\left\{(X, Y): X^{-}<Y^{-}<X^{+}<Y^{+}\right\}$ | $\circ$ | overlaps |
| $\left\{(X, Y): X^{-}=Y^{-}<X^{+}<Y^{+}\right\}$ | s | starts |
| $\left\{(X, Y): Y^{-}<X^{-}<X^{+}=Y^{+}\right\}$ | f | finishes |
| $\left\{(X, Y): Y^{-}<X^{-}<X^{+}<Y^{+}\right\}$ | d | during |
| $\left\{(X, Y): Y^{-}=X^{-}<X^{+}=Y^{+}\right\}$ | $\equiv$ | equal |

and the converse relations (obtained by exchanging $X$ and $Y$ )
$\rightsquigarrow$ These relations are JEPD.

## Disjunctive Descriptions

－Assumption：We don＇t have precise information about the relation between $X$ and $Y$ ，e．g．：

$$
X \circ Y \text { or } X \mathrm{~m} Y
$$

－．．．modelled by sets of base relations（meaning the union of the relations）：

$$
X\{o, m\} Y
$$

$\rightsquigarrow 2^{13}$ imprecise relations（incl．$\emptyset$ and $\mathbf{B}$ ）
Example of an indefinite qualitative description：

$$
\{X\{\mathrm{o}, \mathrm{~m}\} Y, Y\{\mathrm{~m}\} Z, X\{\mathrm{o}, \mathrm{~m}\} Z\}
$$

## Allen＇s Interval Calculus <br> Outlook

## Outlook

－Using the composition table and the rules about operations on relations，we can deduce new relations between time intervals．
－What would be a systematic approach？
－How costly is that？
－Is that complete？
－If not，could it be complete on a subset of the relation system？

Example for Incompleteness

Reasoning in Allen's Interval Calculus NP-Hardness Example

## NP-Hardness

## Theorem (Kautz \& Vilain)

## CSAT is NP-hard for Allen's interval calculus.

Proof.
Reduction from 3-colorability (original proof using 3Sat).
Let $G=(V, E), V=\left\{v_{1}, \ldots, v_{n}\right\}$ be an instance of 3-colorability. Then we use the intervals $\left\{v_{1}, \ldots, v_{n}, 1,2,3\right\}$ with the following constraints:

| 1 | $\{\mathrm{~m}\}$ | 2 |  |
| :---: | :---: | :---: | :--- |
| 2 | $\{\mathrm{~m}\}$ | 3 |  |
| $v_{i}$ | $\left\{\mathrm{~m}, \equiv, \mathrm{~m}^{-1}\right\}$ | 2 | $\forall v_{i} \in V$ |
| $v_{i}$ | $\left\{\mathrm{~m}, \mathrm{~m}^{-1}, \prec, \succ\right\}$ | $v_{j}$ | $\forall\left(v_{i}, v_{j}\right) \in E$ |

This constraint system is satisfiable iff $G$ can be colored with 3 colors.

The Continuous Endpoint Class

Continuous Endpoint Class $\mathcal{C}$ : This is a subset of $\mathcal{A}$ such that there exists a clause form for each relation containing only unit clauses where $\neg(a=b)$ is forbidden.
Example: All basic relations and $\{\mathrm{d}, \mathrm{o}, \mathrm{s}\}$, because

$$
\begin{aligned}
& \pi(X\{\mathrm{~d}, \mathrm{o}, \mathrm{~s}\} Y)=\begin{array}{r} 
\\
\\
X^{-}<X^{+}, Y^{-}<Y^{+}, \\
\\
X^{-}<Y^{+}, X^{+}>Y^{-},
\end{array} \\
& \left.X^{+}<Y^{+}\right\} \\
& Y
\end{aligned}
$$

## Looking for Special Cases

- Idea: Let us look for polynomial special cases. In particular, let us look for sets of relations (subsets of the entire set of relations) that have an easy CSAT problem.
- Note: Interval formulae $X R Y$ can be expressed as clauses over atoms of the form $a$ op $b$, where:
- $a$ and $b$ are endpoints $X^{-}, X^{+}, Y^{-}$and $Y^{+}$and
- $o p \in\{<,>,=, \leq, \geq\}$.
- Example: All base relations can be expressed as unit clauses.

## Lemma

Let $\pi(\Theta)$ be the translation of $\Theta$ to clause form. $\Theta$ is satisfiable over intervals iff $\pi(\Theta)$ is satisfiable over the rational numbers.

Reasoning in Allen's Interval Calculus Completeness for the CEP Class

## Why Do We Have Completeness?

The set $\mathcal{C}$ is closed under intersection, composition, and converse (it is a sub-algebra wrt. these three operations on relations). This can be shown by using a computer program.
Lemma
Each 3-consistent interval CSP over $\mathcal{C}$ is globally consistent.
Theorem (van Beek)
Path consistency solves CMIN(C) and decides $\operatorname{CSAT}(\mathcal{C})$.
Proof.
Follows from the above lemma and the fact that a strongly $n$-consistent CSP is minimal.

Corollary
A path consistent interval CSP consisting of base relations only is satisfiable.

Reasoning in Allen's Interval Calculus Completeness for the CEP Class

## Helly's Theorem

## Definition

A set $M \subseteq \mathbf{R}^{n}$ is convex iff for all pairs of points $a, b \in M$, all points on the line connecting $a$ and $b$ belong to $M$.

Theorem (Helly)
Let $F$ be a family of at least $n+1$ convex sets in $\mathbf{R}^{n}$. If all sub-families of $F$ with $n+1$ sets have a non-empty intersection, then $\bigcap F \neq \emptyset$.

## Strong $n$-Consistency (2): Instantiating the $k$ th Variable

## Proof (Part 2).

The instantiation of the $k-1$ variables $X_{i}$ to $\left(s_{i}, e_{i}\right)$ restricts the instantiation of $X_{k}$
Note: Since $R_{i j} \in \mathcal{C}$ by assumption, these restrictions can be expressed by inequalities of the form:

$$
s_{i}<X_{k}^{+} \wedge e_{j} \geq X_{k}^{-} \wedge \ldots
$$

Such inequalities define convex subsets in $\mathbf{R}^{2}$.
$\rightsquigarrow$ Consider sets of 3 inequalities ( $=3$ convex sets).

Strong $n$-Consistency (1)

Proof.
We prove the claim by induction over $k$ with $k \leq n$.
Base case: $k=1,2,3 \quad \sqrt{ }$
Induction assumption: Assume strong $k-1$-consistency (and non-emptiness of all relations)
Induction step: From the assumption, it follows that there is an instantiation of $k-1$ variables $X_{i}$ to pairs $\left(s_{i}, e_{i}\right)$ satisfying the constraints $R_{i j}$ between the $k-1$ variables.
We have to show that we can extend the instantiation to any $k$ th variable.

## Strong $n$-Consistency (3): Using Helly's Theorem

Proof (Part 3).
Case 1: All 3 inequalities mention only $X_{k}^{-}$(or mention only $X_{k}^{+}$). Then it suffices to consider only 2 of these inequalities (the strongest). Because of 3 -consistency, there exists at least 1 common point satisfying these 3 inequalities.
Case 2: The inequalities mention $X_{k}^{-}$and $X_{k}^{+}$, but it does not contain the inequality $X_{k}^{-}<X_{k}^{+}$. Then there are at most 2 inequalities with the same variable and we have the same situation as in Case 1
Case 3: The set contains the inequality $X_{k}^{-}<X_{k}^{+}$. In this case, only three intervals (incl. $X_{k}$ ) can be involved and by the same argument as above there exists a common point.
$\rightsquigarrow$ With Helly's Theorem, it follows that there exists a consistent instantiation for all subsets of variables.
$\rightsquigarrow$ Strong $k$-consistency for all $k \leq n$.

## Outlook

- $\operatorname{CMIN}(\mathcal{C})$ can be computed in $O\left(n^{3}\right)$ time (for $n$ being the number of intervals) using the path consistency algorithm.
- $\mathcal{C}$ is a set of relations occurring "naturally" when observations are uncertain.
- $\mathcal{C}$ contains 83 relations (incl. the impossible and the universal relations).
- Are there larger sets such that path consistency computes minimal CSPs? Probably not
- Are there larger sets of relations that permit polynomial satisfiability testing? Yes

## The EP-Subclass

End-Point Subclass: $\mathcal{P} \subseteq \mathcal{A}$ is the subclass that permits a clause form containing only unit clauses ( $a \neq b$ is allowed).
Example: all basic relations and $\{\mathrm{d}, \mathrm{o}\}$ since

$$
\begin{aligned}
\pi(X\{\mathrm{~d}, \mathrm{o}\} Y)= & \{ \\
& X^{-}<X^{+}, Y^{-}<Y^{+} \\
& X^{-}<Y^{+}, X^{+}>Y^{-}, X^{-} \neq Y^{-} \\
& \left.X^{+}<Y^{+}\right\}
\end{aligned}
$$

## $Y$

Theorem (Vilain \& Kautz 86, Ladkin \& Maddux 88)
The path-consistency method decides $\operatorname{CSAT}(\mathcal{P})$.

A Maximal Tractable Sub-Algebra
A Maximal Tractable Sub-Algebra

Allen's Interval Calculus

Reasoning in Allen's Interval Calculus

A Maximal Tractable Sub-Algebra
The Endpoint Subclass
The ORD-Horn Subclass
Maximality
Solving Arbitrary Allen CSPs

Literature

Nebel, Helmert, Wölfl (Uni Freiburg)

A Maximal Tractable Sub-Algebra The ORD-Horn Subclass

## The ORD-Horn Subclass

ORD-Horn Subclass: $\mathcal{H} \subseteq \mathcal{A}$ is the subclass that permits a clause form containing only Horn clauses, where only the following literals are allowed:

$$
a \leq b, a=b, a \neq b
$$

$\neg a \leq b$ is not allowed!
Example: all $R \in \mathcal{P}$ and $\left\{o, \mathrm{~s}, \mathrm{f}^{-1}\right\}$ :

$$
\pi\left(X\left\{o, \mathrm{~s}, \mathrm{f}^{-1}\right\} Y\right)=\left\{\begin{array}{l}
X^{-} \leq X^{+}, X^{-} \neq X^{+}, \\
Y^{-} \leq Y^{+}, Y^{-} \neq Y^{+}, \\
\\
X^{-} \leq Y^{-}, \\
\\
X^{-} \leq Y^{+}, X^{-} \neq Y^{+}, \\
\\
Y^{-} \leq X^{+}, X^{+} \neq Y^{-}, \\
\\
\\
\\
\\
\\
\end{array} X^{+} \neq Y^{+}, Y^{-} \vee X^{+} \neq Y^{+}\right\} .
$$

A Maximal Tractable Sub-Algebra The ORD-Horn Subclass

## Partial Orders: The ORD Theory

Let $O R D$ be the following theory:

$$
\begin{array}{lllll}
\forall x, y, z: & x \leq y \wedge y \leq z & \rightarrow x \leq z & \text { (transitivity) } \\
\forall x: & x \leq x & & & \text { (reflexivity) } \\
\forall x, y: & x \leq y \wedge y \leq x & \rightarrow x=y & \text { (anti-symmetry) } \\
\forall x, y: & x=y & \rightarrow x \leq y & \text { (weakening of }=\text { ) } \\
\forall x, y: & x=y & \rightarrow y \leq x & \text { (weakening of }=\text { ). }
\end{array}
$$

- ORD describes partially ordered sets, $\leq$ being the ordering relation
- ORD is a Horn theory
- What is missing wrt to dense and linear orders?

Complexity of $\operatorname{CSAT}(\mathcal{H})$
Let $O R D_{\pi(\Theta)}$ be the propositional theory resulting from instantiating all axioms with the endpoints occurring in $\pi(\Theta)$.
Proposition
$O R D \cup \pi(\Theta)$ is satisfiable iff $O R D_{\pi(\Theta)} \cup \pi(\Theta)$ is so.
Proof idea: Herbrand expansion!

Theorem
$\operatorname{CSAT}(\mathcal{H})$ can be decided in polynomial time.
Proof.
$\operatorname{CSAT}(\mathcal{H})$ instances can be translated into a propositional Horn theory with blowup $O\left(n^{3}\right)$ according to the previous Prop., and such a theory is decidable in polynomial time.

$$
\mathcal{C} \subset \mathcal{P} \subset \mathcal{H} \quad \text { with } \quad|\mathcal{C}|=83,|\mathcal{P}|=188,|\mathcal{H}|=868
$$

Nebel, Helmert, Wölfl (Uni Freiburg)
June 24, 2008

A Maximal Tractable Sub-Algebra The ORD-Horn Subclass

## Satisfiability over Partial Orders

Proposition
Let $\Theta$ be a CSP over $\mathcal{H}$. $\Theta$ is satisfiable over interval interpretations iff $\pi(\Theta) \cup O R D$ is satisfiable over arbitrary interpretations.

Proof.
$\Rightarrow$ : Since the reals form a partially ordered set (i.e., satisfy ORD), this direction is trivial.
$\Leftarrow$ : Each extension of a partial order to a linear order satisfies all formulae of the form $a \leq b, a=b$, and $a \neq b$ which have been satisfied over the original partial order.

## Path-Consistency and the OH-Class

Lemma
Let $\Theta$ be a path-consistent set over $\mathcal{H}$. Then

$$
(X\} Y) \notin \Theta \text { iff } \Theta \text { is satisfiable }
$$

## Proof Idea.

One can show that $O R D_{\pi(\Theta)} \cup \pi(\Theta)$ is closed wrt positive unit resolution. Since this inference rule is refutation complete for Horn theories, the claim follows.

Lemma
$\mathcal{H}$ is closed under intersection, composition, and conversion.
Theorem
The path-consistency method decides $\operatorname{CSAT}(\mathcal{H})$.
$\rightsquigarrow$ Maximality of $\mathcal{H}$ ?
$\rightsquigarrow$ Do we have to check all 8192-868 extensions?
Nebel, Helmert, Wölfl (Uni Freiburg)

A Maximal Tractable Sub-Algebra The ORD-Horn Subclass

## Complexity of Sub-Algebras

Let $\hat{S}$ be the closure of $S \subseteq \mathcal{A}$ under converse, intersection, and composition (i.e., the carrier of the least sub-algebra generated by $S$ )
Theorem
$\operatorname{CSAT}(\hat{S})$ can be polynomially transformed to $\operatorname{CSAT}(S)$.
Proof Idea.
All relations in $\hat{S}-S$ can be modeled by a fixed number of compositions, intersections, and conversions of relations in $S$, introducing perhaps some fresh variables.
$\rightsquigarrow$ Polynomiality of $S$ extends to $\hat{S}$.
$\rightsquigarrow N P-h a r d n e s s$ of $\hat{S}$ is inherited by all generating sets $S$.
$\rightsquigarrow$ Note: $\mathcal{H}=\hat{\mathcal{H}}$.

## "Interesting" Subclasses

Interesting subclasses of $\mathcal{A}$ should contain all basic relations.
A computer-aided case analysis reveals: For $S \supseteq\{\{B\}: B \in \mathbf{B}\}$ it holds that

1. $\hat{S} \subseteq \mathcal{H}$, or
2. $N_{1}$ or $N_{2}$ is in $\hat{S}$.

In case 2, one can show: $\operatorname{CSAT}(S)$ is NP-complete.
$\rightsquigarrow \mathcal{H}$ is the only maximal tractable subclass that is interesting.
Meanwhile, there is a complete classification of all sub-algebras containing at least one basic relation [IJCAI 2001] ... but the question for sub-algebras not containing a basic relation is open.

## A Maximal Tractable Sub-Algebra Maximality

## Minimal Extensions of the $\mathcal{H}$-Subclass

A computer-aided case analysis leads to the following result:
Lemma
There are only two minimal sub-algebras that strictly contain $\mathcal{H}$ : $\mathcal{X}_{1}, \mathcal{X}_{2}$

$$
\begin{aligned}
& N_{1}=\left\{\mathrm{d}, \mathrm{~d}^{-1}, \mathrm{o}^{-1}, \mathrm{~s}^{-1}, \mathrm{f}\right\} \in \mathcal{X}_{1} \\
& N_{2}=\left\{\mathrm{d}^{-1}, \mathrm{o}, \mathrm{o}^{-1}, \mathrm{~s}^{-1}, \mathrm{f}^{-1}\right\} \in \mathcal{X}_{2}
\end{aligned}
$$

The clause form of these relations contain "proper" disjunctions!
Theorem
$\operatorname{CSAT}\left(\mathcal{H} \cup\left\{N_{i}\right\}\right)$ is NP-complete.
Question: Are there other maximal tractable subclasses?

Nebel, Helmert, Wölfl (Uni Freiburg)
KRR

## Relevance?

Theoretical:
We now know the boundary between polynomial and NP-hard reasoning problems along the dimension expressiveness.
Practical: All known applications either need only $\mathcal{P}$ or they need more than $\mathcal{H}$ !
Backtracking methods might profit from the result because the branching factor is lower.
$\rightsquigarrow$ How difficult is $\operatorname{CSAT}(\mathcal{A})$ in practice?
$\rightsquigarrow$ What are the relevant branching factors?

A Maximal Tractable Sub-Algebra Solving Arbitrary Allen CSPs

## Solving General Allen CSPs

- Backtracking algorithm using path-consistency as a forward-checking method
- Relies on tractable fragments of Allen's calculus: split relations into relations of a tractable fragment, and backtrack over these.
- Refinements and evaluation of different heuristics
$\rightsquigarrow$ Which tractable fragment should one use? of events that have duration.
- The satisfiability problem for CSPs using the relations is NP-complete.
- For the continuous endpoint class, minimal CSPs can be computed using the path-consistency method.
- For the larger ORD-Horn class, CSAT is still decided by the path-consistency method.
- Can be used in practice for backtracking algorithms.
- If the labels are split into ORD-Horn relations $(\mathcal{H})$, then on average a label is split into

### 2.533 relations

$\rightsquigarrow$ A difference of 0.422
$\rightsquigarrow$ This makes a difference for "hard" instances.

## Branching Factors

- If the labels are split into base relations, then on average a label is split into

## 6.5 relations

- If the labels are split into pointizable relations $(\mathcal{P})$, then on average a label is split into

### 2.955 relations
