# Informal Example

Male is: the opposite of female  
A human is a kind of: living entity  
A woman is: a human and a female  
A man is: a human and a male  
A mother is: a woman with at least one child that is a human  
A father is: a man with at least one child that is a human  
A parent is: a mother or a father  
A grandmother is: a woman, with at least one child that is a parent  
A mother-wod is: a mother with only male children

Elizabeth is a woman

Elizabeth has the child

Charles

Charles is a man

Diana is a mother-wod

Diana has the child William

**Possible Questions:**

Is a grandmother a parent?

Is Diana a parent?

Is William a man?

Is Elizabeth a mother-wod?

# Atomic Concepts and Roles

- **Concept names:**

- E.g., Grandmother, Male, ... (in the following usually *capitalized*)
- We will use **symbols** such as  $A, A_1, \dots$
- **Semantics:** Monadic predicates  $A(\cdot)$  or set-theoretically a subset of the universe  $A^{\mathcal{I}} \subseteq \mathcal{D}$ .

- **Role names:**

- In our example, e.g., child. Often we will use names such as has-child or something similar (in the following usually *lowercase*).
- Role names are *disjoint* from concept names
- **Symbolically:**  $t, t_1, \dots$
- **Semantics:** Dyadic predicates  $t(\cdot, \cdot)$  or set-theoretically  $t^{\mathcal{I}} \subseteq \mathcal{D} \times \mathcal{D}$ .

# Concept and Role Description

- Out of *concept* and *role names*, complex **descriptions** can be created
- In our example, e.g. “a Human and Female.”
- **Symbolically**:  $C$  for concept descriptions and  $r$  for role descriptions
- Which particular constructs are available depends on the chosen description logic
- **Predicate logic semantics**: A concept descriptions  $C$  corresponds to a formula  $C(x)$  with the free variable  $x$ . Similarly with  $r$ : It corresponds to formula  $r(x, y)$  with free variables  $x, y$ .
- **Set semantics**:

$$C^{\mathcal{I}} = \{d \mid C(d) \text{ “is true in” } \mathcal{I}\}$$

$$r^{\mathcal{I}} = \{(d, e) \mid r(d, e) \text{ “is true in” } \mathcal{I}\}$$

# Role Restrictions

- **Motivation:**

- Often we want to describe something by *restricting* the possible “fillers” of a role, e.g. Mother-wod.
- Sometimes we want to say that there is at least a filler of a particular type, e.g. Grandmother

- **Idea:** Use **quantifiers** that range over the role-fillers

- $\text{Mother} \sqcap \forall \text{has-child.Man}$
- $\text{Woman} \sqcap \exists \text{has-child.Parent}$

- **Predicate logic semantics:**

$$\begin{aligned}(\exists r.C)(x) &= \exists y : (r(x, y) \wedge C(y)) \\ (\forall r.C)(x) &= \forall y : (r(x, y) \rightarrow C(y))\end{aligned}$$

- **Set semantics:**

$$\begin{aligned}(\exists r.C)^{\mathcal{I}} &= \{d \mid \exists e : (d, e) \in r^{\mathcal{I}} \wedge e \in C^{\mathcal{I}}\} \\ (\forall r.C)^{\mathcal{I}} &= \{d \mid \forall e : (d, e) \in r^{\mathcal{I}} \rightarrow e \in C^{\mathcal{I}}\}\end{aligned}$$

# Cardinality Restriction

- **Motivation:**

- Often we want to describe something by *restricting the number* of possible “fillers” of a role, e.g., a Mother with at least 3 children or at most 2 children.

- **Idea:** We restrict the cardinality of the role filler sets:

- $\text{Mother} \sqcap (\geq 3 \text{ has-child})$
- $\text{Mother} \sqcap (\leq 2 \text{ has-child})$

- **Predicate logic semantics:**

$$(\geq n r)(x) = \exists y_1 \dots y_n : (r(x, y_1) \wedge \dots \wedge r(x, y_n) \wedge y_1 \neq y_2 \wedge \dots \wedge y_{n-1} \neq y_n)$$

$$(\leq n r)(x) = \neg(\geq n + 1 r)(x)$$

- **Set semantics:**

$$\begin{aligned}(\geq n r)^{\mathcal{I}} &= \{d \mid |\{e \mid r^{\mathcal{I}}(d, e)\}| \geq n\} \\ (\leq n r)^{\mathcal{I}} &= \mathcal{D} - (\geq n + 1 r)^{\mathcal{I}}\end{aligned}$$

# Some Reasoning Services

- Does a description  $C$  make sense at all, i.e., is it **satisfiable**?
- A concept description  $C$  is satisfiable iff there exists an interpretation  $\mathcal{I}$  such that  $C^{\mathcal{I}} \neq \emptyset$ .
- Is one concept a specialization of another one, is it **subsumed**?
- $C$  is **subsumed by**  $D$ , in symbols  $C \sqsubseteq D$  iff we have for all interpretations  $C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$ .
- Is  $a$  an **instance** of a concept  $C$ ?
- $a$  is an instance of  $C$  iff for all interpretations, we have  $a^{\mathcal{I}} \in C^{\mathcal{I}}$ .
- **Note:** These questions can be posed with or without a TBox that restricts the possible interpretations.
