# Motivation: Reasoning Services

- What do we want to know?
- We want to check whether the *knowledge base* is reasonable:
  - Is each defined concept in a TBox satisfiable?
  - Is a given TBox satisfiable?
  - Is a given ABox satisfiable?
- What can we **conclude** from the represented knowledge?
  - Is concept  $X$  **subsumed** by concept  $Y$ ?
  - Is an object  $a$  **instance** of a concept  $X$ ?
- These problems can be **reduced** to logical satisfiability or implication – using the logical semantics.
- We take a different route: We will try to simplify these problems and then we specify *direct inference methods*.

# Satisfiability of Concept Descriptions in a TBox

- **Motivation:** Given a TBox  $\mathcal{T}$  and a concept description  $C$ , does  $C$  make sense, i.e., is  $C$  **satisfiable**?
- **Test:**
  - Does there exist a *model*  $\mathcal{I}$  of  $\mathcal{T}$  such that  $C^{\mathcal{I}} \neq \emptyset$ ?
  - Is the formula  $\exists x: C(x)$  together with the formulas resulting from the translation of  $\mathcal{T}$  satisfiable?
- **Example:** *Mother-without-daughter*  $\sqcap$  *has-child.Female* is unsatisfiable.

# Reduction: Getting Rid of the TBox

- We can **reduce** satisfiability in a TBox to simple satisfiability.
- **Idea:**
  - Since TBoxes are *cycle-free*, one can understand a concept definition as a kind of “macro”
  - For a given TBox  $\mathcal{T}$  and a given concept description  $C$ , all defined concept symbols appearing in  $C$  can be *expanded* until  $C$  contains only undefined concept symbols
  - An *expanded* concept description is then satisfiable iff  $C$  is satisfiable in  $\mathcal{T}$
  - *Problem:* What do we do with partial definitions (using  $\sqsubseteq$ )?

# Normalized Terminologies

- A terminology is called **normalized** when it does not contain definitions using  $\sqsubseteq$ .
- In order to *normalize* a terminology, replace

$$A \sqsubseteq C$$

by

$$A \doteq A^* \sqcap C,$$

where  $A^*$  is a **fresh** concept symbol (not appearing elsewhere in  $\mathcal{T}$ ).

- If  $\mathcal{T}$  is a terminology, the normalized terminology is denoted by  $\tilde{\mathcal{T}}$ .

# Normalizing is Reasonable

## Theorem (Normalization Invariance)

If  $\mathcal{I}$  is a model of the terminology  $\mathcal{T}$ , then there exists a model  $\mathcal{I}'$  of  $\tilde{\mathcal{T}}$  (and vice versa) such that for all concept symbols  $A$  appearing in  $\mathcal{T}$  we have:

$$A^{\mathcal{I}} = A^{\mathcal{I}'}$$

Proof.

“ $\Rightarrow$ ”: Let  $\mathcal{I}$  be a model of  $\mathcal{T}$ . This model should be *extended* to  $\mathcal{I}'$  so that the freshly introduced concept symbols also get interpretations. Assume  $(A \sqsubseteq C) \in \mathcal{T}$ , i.e., we have  $(A \doteq A^* \sqcap C) \in \tilde{\mathcal{T}}$ . Then set  $A^{*\mathcal{I}'} = A^{\mathcal{I}}$ .  $\mathcal{I}'$  obviously satisfies  $\tilde{\mathcal{T}}$  and has the same interpretation for all symbols in  $\mathcal{T}$ .

$\Leftarrow$  Given a model  $\mathcal{I}'$  of  $\tilde{\mathcal{T}}$ , its restriction to symbols of  $\mathcal{T}$  is the interpretation we looked for. □

# TBox Unfolding

- We say that a *normalized TBox* is **unfolded by one step** when all defined concept symbols on the right sides are replaced by their defining terms.
- **Example:**  $\text{Mother} \doteq \text{Woman} \sqcap \dots$  is unfolded to  $\text{Mother} \doteq (\text{Human} \sqcap \text{Female}) \sqcap \dots$
- We write  $U(\mathcal{T})$  to denote a one-step unfolding and  $U^n(\mathcal{T})$  to denote an *n-step unfolding*.
- We say  $\mathcal{T}$  is **unfolded** if  $U(\mathcal{T}) = \mathcal{T}$ .
- We say that  $U^n(\mathcal{T})$  is the **unfolding** of  $\mathcal{T}$  if  $U^n(\mathcal{T}) = U^{n+1}(\mathcal{T})$ . If such an unfolding exists, it is denoted by  $\hat{\mathcal{T}}$

# Generating Models

- All concept and role names *not appearing on the left hand side* in a terminology  $\mathcal{T}$  are called **primitive components**.
- Interpretations restricted to primitive components are called **initial interpretations**.

## Theorem (Model extension)

*For each initial interpretation  $\mathcal{J}$  of a normalized TBox, there exists a unique interpretation  $\mathcal{I}$  extending  $\mathcal{J}$  and satisfying  $\mathcal{T}$ .*

## Proof idea.

Use  $\hat{\mathcal{T}}$  and compute an interpretation for all defined symbols.

## Corollary (Model existence for TBoxes)

*Each TBox has at least one model.*

# Unfolding of Concept Descriptions

- Similar to the unfolding of TBoxes, we can define **unfolding of concept descriptions**.
- We write  $\hat{C}$  for the **unfolded version** of  $C$ .

## Theorem (Satisfiability of unfolded concepts)

*An concept description  $C$  is satisfiable in a terminology  $\mathcal{T}$  iff  $\hat{C}$  is satisfiable in an empty terminology.*

## Proof.

“ $\Rightarrow$ ”: trivial.

“ $\Leftarrow$ ”: Use the interpretation for all the symbols in  $\hat{C}$  to generate an initial interpretation of  $\mathcal{T}$ . Then extend it to a full model  $\mathcal{I}$  of  $\mathcal{T}$ .

This satisfies  $\mathcal{T}$  as well as  $\hat{C}$ . Since  $\hat{C}^{\mathcal{I}} = C^{\mathcal{I}}$ , it satisfies also  $C$ .  $\square$

# ABox Satisfiability

- **Motivation:** An ABox should *model* the real world, i.e., it should have a **model**.
- **Test:** Check for a model
- **Example:**

$$\begin{aligned} X &: (\forall r. \neg C) \\ Y &: C \\ (X, Y) &: r \end{aligned}$$

is not satisfiable.

# ABox Satisfiability in a TBox

- **Motivation:** Is a given ABox  $\mathcal{A}$  compatible with the terminology introduced in  $\mathcal{T}$ ?
- **Test:** Is  $\mathcal{T} \cup \mathcal{A}$  satisfiable?
- **Example:** If we extend our example with  
MARGRET: Woman  
(DIANA, MARGRET): has-child,  
then the ABox becomes unsatisfiable in the given TBox.
- **Reduction:**
  - to satisfiability of an ABox
  - *Normalize* terminology, then *unfold* all concept and role descriptions in the ABox

# Instance Relations

- **Motivation:** Which additional ABox formulas of the form  $a: C$  follow logically from a given ABox and TBox?
- **Test:**
  - Is  $a^{\mathcal{I}} \in C^{\mathcal{I}}$  true in all models of  $\mathcal{I}$  of  $\mathcal{T} \cup \mathcal{A}$ ?
  - Does the formula  $C(a)$  logically follow from the translation of  $\mathcal{A}$  and  $\mathcal{T}$  to predicate logic?
- **Reductions:**
  - Instance relations wrt. an ABox and a TBox can be reduced to instance relations wrt. ABox.
  - Use *normalization* and *unfolding*
  - Instance relations in an ABox can be reduced to ABox unsatisfiability:

$a: C$  holds in  $\mathcal{A}$  iff  $\mathcal{A} \cup \{a: \neg C\}$  is unsatisfiable

Summary and  
Outlook

- How to determine *subsumption* between two concept description (in the empty TBox)?
- How to determine *instance relations/ABox satisfiability*?
- How to implement the mentioned reductions *efficiently*?
- Does normalization and unfolding introduce another source of *computational complexity*?
