

Multi-Agent Systems

Albert-Ludwigs-Universität Freiburg

Bernhard Nebel, Felix Lindner, and Thorsten Engesser
Summer Term 2017

Course outline

- 1 Introduction
- 2 Agent-Based Simulation
- 3 Agent Architectures
- 4 Beliefs, Desires, Intentions
 - The GOAL Agent Programming Language
 - Introduction to Modal Logics
 - Epistemic Logic
 - BDI Logic
- 5 Norms and Duties
- 6 Communication and Argumentation
- 7 Coordination and Decision Making

Nebel, Lindner, Engesser – MAS

2 / 24

BDI Agent

```
function BDI-AGENT(percept)  
  global beliefs, desires, intentions  
  beliefs ← UPDATE-BELIEF(beliefs, percept)  
  desires ← OPTIONS(beliefs, intentions)  
  intentions ← FILTER(beliefs, intentions, desires)  
  action ← MEANS-END-REASONING(intentions)  
  beliefs ← UPDATE-BELIEF(action)  
  return action
```

end function

- BDI agents start out with some **beliefs** and **intentions**.
- Intentions are goals the agent has actually chosen to bring about (can be adopted and dropped).
- Beliefs and intentions constrain what the agent **desires**.
- Together, B, D, and I determine the agent's future intentions.

Nebel, Lindner, Engesser – MAS

3 / 24

Signatures of main processes

- The alternatives for action (options) for an agent is a set of desires dependent on the agent's beliefs and its intentions:

$$options : 2^{Bel} \times 2^{Int} \rightarrow 2^{Des}$$

- To select between competing options, an agent uses a filter function. This choice depends on the agent's beliefs, current options (desires), and intentions:

$$filter : 2^{Bel} \times 2^{Des} \times 2^{Int} \rightarrow 2^{Int}$$

⇒ Prior intentions serve as **input!** They provide a **filter of admissibility** for options, and thereby “provide a [...] purpose for deliberation, rather than merely a general injunction to do the best.” (Bratman, 1987, p. 33)

Nebel, Lindner, Engesser – MAS

4 / 24

Intentions: Main properties

- **Intentions drive means-ends reasoning:** If I adopt an intention, I will attempt to achieve it.
- **Intentions persist:** Once adopted they will not be dropped until achieved, deemed unachievable, or reconsidered.
- **Intentions constrain future deliberation:** Filter of admissibility. Options inconsistent with current intentions will not be entertained.
- **Intentions influence beliefs upon which future practical reasoning is based:** Rationality requires that I believe that I can achieve my intentions.

Comparison: Intention vs. Desire

- Desires, similar to intentions, are states of affairs considered for achievement (or actions considered for execution), i.e., basic preferences of an agent.
- Unlike desires, intentions involve a commitment to bringing them about.
- Unlike desires, intentions must be consistent.

(Bratman, 1990, after Wooldridge, p. 67)

My desire to play basketball this afternoon is merely a potential influence of my conduct this afternoon. It must vie with my other relevant desires [...] before it is settled what I will do. In contrast, once I intend to play basketball this afternoon, the matter is settled: I normally need not continue to weigh the pros and cons. When the afternoon arrives, I will normally just proceed to execute my intentions.

Role in explanations

- “I **want** to have some icecream, and I **believe** there is icecream in the freeze, and I **choose** to have some icecream, therefore, I go to the freeze to get some icecream.”
- Each of these three clauses constitutes an adequate **explanation**.
- Beliefs, desires, and intentions are **reason-giving forces**.

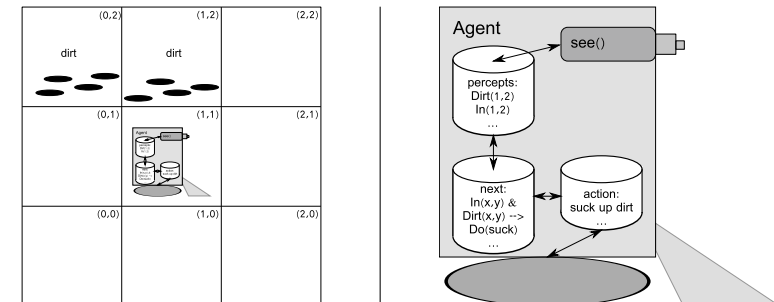

BDI Frameworks

- Just to name a few
 - Jason: <http://jason.sourceforge.net/>
 - 3APL: <https://en.wikipedia.org/wiki/3APL>
 - 2APL: <http://apapl.sourceforge.net/>
 - JADEX: <http://vsis-www.informatik.uni-hamburg.de/projects/jadex/>
 - GOAL: <https://goalapl.atlassian.net/wiki>
- Different technologies, e.g., Prolog-style knowledge bases vs. XML files vs. Java Objects
- Different formalizations of BDI, e.g., AgentSpeak, GOAL

- **GOAL** emphasizes programming **cognitive agents**.
- Cognitive agents maintain a cognitive state that consists of **knowledge** and **goals**.
 - Knowledge: Facts the agent believes are true.
 - Goals: Facts the agent wants to be true.
- Cognitive state is represented in some **knowledge representation** (KR) language.
- Cognitive agents derive their **choice of action** from their knowledge and goals.

- Percepts: dirt, orientation (N, S, E, W)
- Knowledge: In/2, dirt/0, clean/0. initial KB: In(0, 0), *¬clean*
- Goal: clean [*Note: clean cannot be perceived but must be inferred!*]
- Actions: suck, step forward, turn right (90°)

- Mind-body metaphor:
 - Agents (mind) are connected to controllable entities (body) living in some environment.
 - Agents receive percepts from the environment through their controlled entities.
 - Agents decide what the controlled entities will do.
- Controlled entities: A car in a Nagel-Schreckenberg-Simulation, a bot in Unreal Tournament, a robot, ...

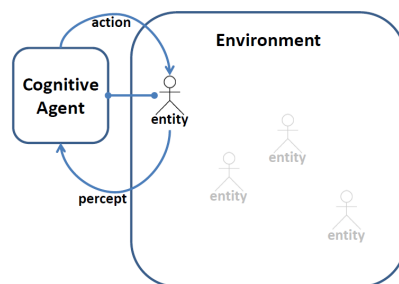

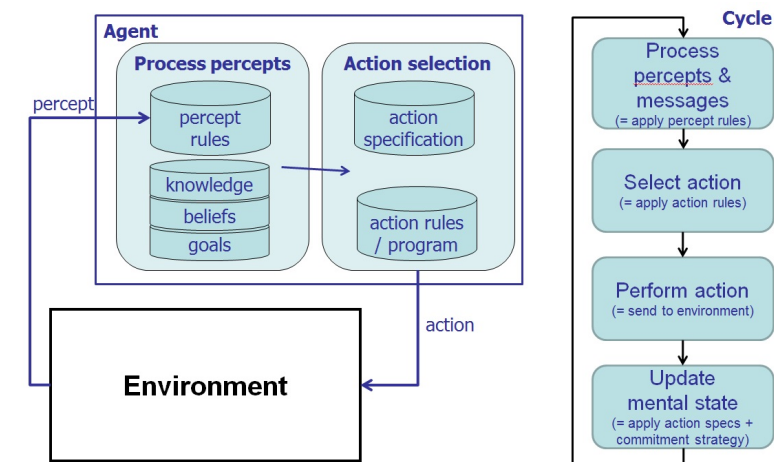

Fig.: Source [1]

```
printColor(snow) :- !, write("It's white").
printColor(grass) :- !, write("It's green").
printColor(soccerGround) :- !, printColor(grass).
printColor(X) :- write("Hello world").
```

versus

```
color(snow, white).
color(grass, green).
color(X, Y) :- madeOf(X, Z), color(Z, Y).
madeOf(soccerGround, grass).
printColor(X) :- color(X, Y), !, write("It's "), write(Y), write(".").
printColor(X) :- write("Hello world").
```

⇒ Single- vs. multi-purpose, Cognitive penetrability

Example originally from Brachmann & Levesque (2004)

- Classical formalism for knowledge representation: **First-Order Logic (FOL)**
- Ontological assumption: World consist of **objects** and **relations** between these objects.
- FOL syntax
 - **Predicate Symbols**: Beautiful/1, MotherOf/2, Between/3
 - **Terms**:
 - **Constant Symbols**: john, mary, cat-7
 - **Function Symbols**: f, g, ...
 - **Variables**: x, y, ...
 - **Quantifiers**: \forall, \exists
 - **Connectives**: $\wedge, \vee, \neg, \rightarrow, \dots$
- "Maria is the mother of John's (only) girlfriend."
 - $motherOf(maria, girlfriend(john))$
 - $\forall X [girlfriend(X, john) \rightarrow motherOf(maria, X)]$

- **Structures**: $\mathcal{A} = (U, I)$
 - **Variables and Constants**: $I(c) \in U$
 - **Function Symbols (n-ary)**: $I(f) : U^n \rightarrow U$
 - **Predicate Symbols (n-ary)**: $I(P) \subseteq U^n$
- **Example**
 - $\mathcal{A}_1 = (U_1 = \{maria, susi, john\}, I_1), I_1(maria) = maria, I_1(susi) = susi, I_1(john) = john, I_1(girlfriend) = \{john \mapsto susi\}, I_1(motherOf) = \{(maria, susi)\}$
 - $\mathcal{A}_2 = (U_2 = U_1, I_2)$ similar to \mathcal{A}_1 but $I_2(motherOf) = \{(maria, john)\}$
 - We want to be able to say that structure \mathcal{A}_1 is a **model** for the formula $motherOf(maria, girlfriend(john))$ and \mathcal{A}_2 is not.

- $\mathcal{A} \models P(t_1, \dots, t_n)$ iff. $(I(t_1), \dots, I(t_n)) \in I(P)$
- $\mathcal{A} \models \neg \phi$ iff not $\mathcal{A} \models \phi$
- $\mathcal{A} \models (\phi \wedge \psi)$ iff $\mathcal{A} \models \phi$ and $\mathcal{A} \models \psi$
- $\mathcal{A} \models (\phi \vee \psi)$ iff $\mathcal{A} \models \phi$ or $\mathcal{A} \models \psi$ (or both)
- $\mathcal{A} \models \exists x(\phi)$ iff $\mathcal{A}_{[x/d]} \models \phi$ for some $d \in U$
- $\mathcal{A} \models \forall x(\phi)$ iff $\mathcal{A}_{[x/d]} \models \phi$ for all $d \in U$
- \mathcal{A} is a **model** of ϕ iff $\mathcal{A} \models \phi$.
- ϕ is **satisfiable** iff $\mathcal{A} \models \phi$ for some \mathcal{A} .
- ϕ is **valid** iff $\mathcal{A} \models \phi$ for all \mathcal{A} .
- ϕ **entails** ψ iff every model of ϕ is also a model of ψ .

- GOAL uses Prolog as knowledge representation formalism
 - Based on Horn fragment of First-Order Logic, programs evaluated by logical proof. Prolog adds procedures for arithmetics and input/output handling.
- Knowledge Base
 - Rules: `motherOf(maria, X) :- girlfriend(X, john).`
 - Facts: `girlfriend(susi, john).`
- Sample Queries
 - `? :- motherOf(maria, susi).` **yes**
 - `? :- motherOf(maria, bernie).` **no**
 - `? :- motherOf(maria, C).` **C = susi.**
 - `? :- motherOf(maria, susi), not(motherOf(maria, bernie)).`
yes

- Program: `motherOf(maria, X) :- girlfriend(X, john).`
`girlfriend(susi, john).`
- Query: `? :- motherOf(maria, susi).`
- Remember Entailment: The program entails the query iff every model of the program is a model of the query, $Program \models Query$.
 - I.e., none of the program's models is a model of the negation of the query.
 - I.e., there is no model for the conjunction of the program and the negation of the query.
 - Thus, the entailment can be proven by showing that $Program \wedge \neg Query \models \perp$

- Program: `motherOf(maria, X) :- girlfriend(X, john).`
`girlfriend(susi, john).`
- Query: `? :- motherOf(maria, susi).`
- Show: $\{\neg gi(X, j) \vee mo(m, X), gi(s, j), \neg mo(m, s)\} \models \perp$

- 1 $\neg mo(m, s), \neg gi(X, j) \vee mo(m, X) \rightsquigarrow_{[X/s]} \neg gi(s, j)$
- 2 $\neg gi(s, j), gi(s, j) \rightsquigarrow_{[]} \perp$

and the negation of the query. \Rightarrow Every model of the

- Program: `motherOf(maria, X) :- girlfriend(X, john).`
`girlfriend(susi, john).`
- Query: `? :- motherOf(maria, C).`
- Idea: Ask for `answer(C) :- motherOf(maria, C)`
- $\{\neg gi(X, j) \vee mo(m, X), gi(s, j), \neg mo(m, C) \vee answer(C)\}$

- 1 $\neg mo(m, C) \vee answer(C), \neg gi(X, j) \vee mo(m, X) \rightsquigarrow_{[C/X]} \neg gi(s, j) \vee answer(s)$
- 2 $answer(X) \vee \neg gi(X, j), gi(s, j) \rightsquigarrow_{[X/s]} answer(s)$

- We will try to avoid programming in Prolog, but we will make use of it:
 - Adding facts to the agent's KB: **insert**(at(1, 2))
 - Removing facts from the agent's KB: **delete**(at(1, 1))
 - Adding goals to the agent's KB: **adopt**(at(7, 7))
 - Asking what the agent believes about some fact:
 - Am I at position (1, 1)? **bel**(at(1, 1))
 - Where am I? **bel**(at(X, Y))
 - Writing rules:
 - **forall** **bel**(at(X1, Y1)), **percept**(at(X2, Y2)) **then** **delete**(at(X1, Y1) + **insert**(at(X2, Y2)).
 - **if** **bel**(at(1, 1), **lectureAt**(1, 1)), **not(goal(enlightened))** **then** sleep.
 - **If** **goal**(at(X1, Y1)), **bel**(at(X1, Y2), Y2 > Y1, D is Y2 - Y1) **then** goNorth(D).
 - For more, study the GOAL manual [1],
<https://goalapl.atlassian.net/wiki/>.

- We want to do first steps towards programming an agent for the Wumpus world.
 - 1 **Ontology Design**
 - 1 Identify percepts
 - 2 Identify environment actions
 - 3 Design an ontology to represent the agent's environment
 - 4 Identify the goals of agents
 - 2 **Strategy Design**
 - 1 Write event rules
 - 2 Write action specifications
 - 3 Determine action selection strategy
 - 4 Write decision rules
