- Resolution strategies

- Horn clauses

Why Logic?

- ▶ Logic is one of the best developed system for representing knowledge.
- ▶ Can be used for analysis, design and specification.
- ▶ Understanding formal logic is a prerequisite for understanding most research papers in KRR.

The Right Logic ...

- ▶ Logics of different **orders** (1st, 2nd, ...)
- ▶ **Modal** logics
 - ▶ epistemic
 - ▶ temporal
 - ▶ dynamic (program)
 - ▶ multi-
 - ▶ ...
- ▶ **Many-valued** logics
- ▶ **Conditional** logics
- ▶ **Nonmonotonic** logics
- ▶ **Linear** logics
- ▶ ...

The Logical Approach

- ▶ Define a **formal language**
- ▶ logical & non-logical symbols, syntax rules
- ▶ Provide language with **compositional semantics**
 - ▶ Fix **universe** of discourse
 - ▶ Specify how the non-logical symbols can be **interpreted**
 - ▶ interpretation
 - ▶ Rules how to **combine** interpretation of single symbols
 - ▶ **Satisfying interpretation = model**
 - ▶ From that logical implication/entailment follows
- ▶ Specify a **calculus** that allows to derive new formulae from old ones – according to the entailment relation

Propositional Logic: Main Ideas

- ▶ Non-logical symbols: propositional **variables** or **atoms**
 - ▶ representing **propositions** which cannot be decomposed
 - ▶ which can be **true** or **false**
 - ▶ for example:
 - ▶ “Snow is white”
 - ▶ “It rains”
- ▶ Logical Symbols: propositional connectives such as **and** (\wedge), **or** (\vee), and **not** (\neg).
- ▶ Formulae: built out of atoms and connectives
- ▶ Universe of discourse: truth values

Syntax

Countable alphabet Σ of atomic propositions: a, b, c, \dots

Propositional formulae are built according to the following rule:

φ	\longrightarrow	a	<i>atomic formula</i>
		\perp	<i>falsity</i>
		\top	<i>truth</i>
		$(\neg\varphi')$	<i>negation</i>
		$(\varphi' \wedge \varphi'')$	<i>conjunction</i>
		$(\varphi' \vee \varphi'')$	<i>disjunction</i>
		$(\varphi' \rightarrow \varphi'')$	<i>implication</i>
		$(\varphi' \leftrightarrow \varphi'')$	<i>equivalence</i>

Parenthesis can be omitted if no ambiguity arises.

Operator precedence: $\neg > \wedge > \vee > \rightarrow = \leftrightarrow$.

Semantics: Idea

- ▶ Atomic propositions can be true ($1, T$) or false ($0, F$).
- ▶ Provided the truth values of the atoms have been fixed (**truth assignment** or **interpretation**), the truth value of a formula can be computed from the truth values of the atoms and the connectives.

- ▶ Example:

$$(a \vee b) \wedge c$$

is true *iff* c is true and additionally a or b is true.

- ▶ Logical implication can then be defined as follows:
- ▶ φ is **implied** by the formulae Θ *iff* φ is true for all truth assignments (world states) that make all formulae in Θ true.

Formal Semantics

An **interpretation** or **truth assignment** over Σ is a function: $I : \Sigma \rightarrow \{T, F\}$.
 A formula ψ is **true under** I or is **satisfied by** I (symbolically $I \models \psi$):

$$I \models a \quad \text{iff} \quad I(a) = T$$

$$I \models \top$$

$$I \not\models \perp$$

$$I \models \neg\phi \quad \text{iff} \quad I \not\models \phi$$

$$I \models \phi \wedge \phi' \quad \text{iff} \quad I \models \phi \text{ and } I \models \phi'$$

$$I \models \phi \vee \phi' \quad \text{iff} \quad I \models \phi \text{ or } I \models \phi'$$

$$I \models \phi \rightarrow \phi' \quad \text{iff} \quad \text{if } I \models \phi, \text{ then } I \models \phi'$$

$$I \models \phi \leftrightarrow \phi' \quad \text{iff} \quad I \models \phi \text{ if and only if } I \models \phi'$$

Example

Given

$$I : a \mapsto T, b \mapsto F, c \mapsto F, d \mapsto T,$$

Is $((a \vee b) \leftrightarrow (c \vee d)) \wedge (\neg(a \wedge c) \vee (c \wedge \neg d))$ true or false?

$$((\mathbf{a} \vee \mathbf{b}) \leftrightarrow (\mathbf{c} \vee \mathbf{d})) \wedge (\neg(\mathbf{a} \wedge \mathbf{c}) \vee (\mathbf{c} \wedge \neg \mathbf{d}))$$

$$((\mathbf{a} \vee \mathbf{b}) \leftrightarrow (\mathbf{c} \vee \mathbf{d})) \wedge (\neg(\mathbf{a} \wedge \mathbf{c}) \vee (\mathbf{c} \wedge \neg \mathbf{d}))$$

$$((\mathbf{a} \vee \mathbf{b}) \leftrightarrow (\mathbf{c} \vee \mathbf{d})) \wedge (\neg(\mathbf{a} \wedge \mathbf{c}) \vee (\mathbf{c} \wedge \neg \mathbf{d}))$$

$$((\mathbf{a} \vee \mathbf{b}) \leftrightarrow (\mathbf{c} \vee \mathbf{d})) \wedge (\neg(\mathbf{a} \wedge \mathbf{c}) \vee (\mathbf{c} \wedge \neg \mathbf{d}))$$

$$((\mathbf{a} \vee \mathbf{b}) \leftrightarrow (\mathbf{c} \vee \mathbf{d})) \wedge (\neg(\mathbf{a} \wedge \mathbf{c}) \vee (\mathbf{c} \wedge \neg \mathbf{d}))$$

Terminology

An interpretation I is a **model** of φ iff

$$I \models \varphi$$

A formula φ is

- ▶ **satisfiable** iff there is I such that $I \models \varphi$,
- ▶ **unsatisfiable** otherwise, and
- ▶ **valid** iff $I \models \varphi$ for all I ,
- ▶ **falsifiable** otherwise.

Two formulae φ and ψ are **logically equivalent** (symbolically $\varphi \equiv \psi$) iff for all interpretations I

$$I \models \varphi \text{ iff } I \models \psi.$$

Examples

Satisfiable, unsatisfiable, falsifiable, valid?

$$(a \vee b \vee \neg c) \wedge (\neg a \vee \neg b \vee d) \wedge (\neg a \vee b \vee \neg d)$$

\rightsquigarrow satisfiable: $a \mapsto T, b \mapsto F, d \mapsto F, \dots$

\rightsquigarrow falsifiable: $a \mapsto F, b \mapsto F, c \mapsto T, \dots$

$$((\neg a \rightarrow \neg b) \rightarrow (b \rightarrow a))$$

\rightsquigarrow satisfiable: $a \mapsto T, b \mapsto T$

\rightsquigarrow valid: Consider all interpretations or argue about falsifying ones.

Equivalence?

$$\neg(a \vee b) \equiv \neg a \wedge \neg b$$

\rightsquigarrow Of course, equivalent (de Morgan).

Some Obvious Consequences

Proposition

φ is valid iff $\neg\varphi$ is unsatisfiable and φ is satisfiable iff $\neg\varphi$ is falsifiable.

Proposition

$\varphi \equiv \psi$ iff $\varphi \leftrightarrow \psi$ is valid.

Theorem

If $\varphi \equiv \psi$ and χ' results from substituting φ by ψ in χ , then $\chi' \equiv \chi$.

Some Equivalences

simplifications	$\varphi \rightarrow \psi$	\equiv	$\neg\varphi \vee \psi$	$\varphi \leftrightarrow \psi$	\equiv	$(\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)$
idempotency	$\varphi \vee \varphi$	\equiv	φ	$\varphi \wedge \varphi$	\equiv	φ
commutativity	$\varphi \vee \psi$	\equiv	$\psi \vee \varphi$	$\varphi \wedge \psi$	\equiv	$\psi \wedge \varphi$
associativity	$(\varphi \vee \psi) \vee \chi$	\equiv	$\varphi \vee (\psi \vee \chi)$	$(\varphi \wedge \psi) \wedge \chi$	\equiv	$\varphi \wedge (\psi \wedge \chi)$
absorption	$\varphi \vee (\varphi \wedge \psi)$	\equiv	φ	$\varphi \wedge (\varphi \vee \psi)$	\equiv	φ
distributivity	$\varphi \wedge (\psi \vee \chi)$	\equiv	$(\varphi \wedge \psi) \vee$ $(\varphi \wedge \chi)$	$\varphi \vee (\psi \wedge \chi)$	\equiv	$(\varphi \vee \psi) \wedge$ $(\varphi \vee \chi)$
double negation	$\neg\neg\varphi$	\equiv	φ			
constants	$\neg\top$	\equiv	\perp	$\neg\perp$	\equiv	\top
De Morgan	$\neg(\varphi \vee \psi)$	\equiv	$\neg\varphi \wedge \neg\psi$	$\neg(\varphi \wedge \psi)$	\equiv	$\neg\varphi \vee \neg\psi$
truth	$\varphi \vee \top$	\equiv	\top	$\varphi \wedge \top$	\equiv	φ
falsity	$\varphi \vee \perp$	\equiv	φ	$\varphi \wedge \perp$	\equiv	\perp

How Many Different Formulae Are There ...

... for a given *finite* alphabet Σ ?

- ▶ Infinitely many: $a, a \vee a, a \wedge a, a \vee a \vee a, \dots$
- ▶ How many different logically distinguishable (non-equivalent) formulae?
 - ▶ For Σ with $n = |\Sigma|$, there are 2^n different interpretations.
 - ▶ A formula can be characterized by its set of models
(if two formulae are logically non-equivalent then their sets of models differ).
 - ▶ There are $2^{(2^n)}$ different sets of interpretations.
 - ▶ There are $2^{(2^n)}$ logical equivalence classes of formulae.

Logical Implication

- ▶ Extension of the relation \models to sets Θ of formulae:

$$I \models \Theta \text{ iff } I \models \varphi \text{ for all } \varphi \in \Theta.$$

- ▶ φ is **logically implied** by Θ (symbolically $\Theta \models \varphi$) iff φ is true in all models of Θ :

$$\Theta \models \varphi \text{ iff } I \models \varphi \text{ for all } I \text{ such that } I \models \Theta$$

- ▶ Some consequences:

- ▶ Deduction theorem: $\Theta \cup \{\varphi\} \models \psi$ iff $\Theta \models \varphi \rightarrow \psi$
- ▶ Contraposition: $\Theta \cup \{\varphi\} \models \neg\psi$ iff $\Theta \cup \{\psi\} \models \neg\varphi$
- ▶ Contradiction: $\Theta \cup \{\varphi\}$ is unsatisfiable iff $\Theta \models \neg\varphi$

Normal Forms

Terminology:

- ▶ Atomic formulae a , negated atomic formulae $\neg a$, truth \top and falsity \perp are **literals**.
- ▶ A disjunction of literals is a **clause**.
- ▶ If \neg only occurs in front of an atom and there are no occurrences of \rightarrow and \leftrightarrow , the formula is in **negation normal form (NNF)**.
Example: $(\neg a \vee \neg b) \wedge c$, but not: $\neg(a \wedge b) \wedge c$
- ▶ A conjunction of clauses is in **conjunctive normal form (CNF)**.
Example: $(a \vee b) \wedge (\neg a \vee c)$
- ▶ The dual form (disjunction of conjunctions of literals) is in **disjunctive normal form (DNF)**.
Example: $(a \wedge b) \vee (\neg a \wedge c)$

Negation Normal Form

Theorem

For each propositional formula there is a logically equivalent formula in NNF.

Proof.

First eliminate \rightarrow and \leftrightarrow by the appropriate equivalences. The rest of the proof is by structural induction.

Base case: Claim is true for a , $\neg a$, \top , \perp .

Inductive case: Assume claim is true for all formulae φ (up to a certain number of connectives) and call its NNF $nnf(\varphi)$.

- ▶ $nnf(\varphi \wedge \psi) = nnf(\varphi) \wedge nnf(\psi)$
- ▶ $nnf(\varphi \vee \psi) = nnf(\varphi) \vee nnf(\psi)$
- ▶ $nnf(\neg(\varphi \wedge \psi)) = nnf(\neg\varphi) \vee nnf(\neg\psi)$
- ▶ $nnf(\neg(\varphi \vee \psi)) = nnf(\neg\varphi) \wedge nnf(\neg\psi)$
- ▶ $nnf(\neg(\neg\varphi)) = nnf(\varphi)$

Conjunctive Normal Form

Theorem

For each propositional formula there is a logically equivalent formula in CNF. A similar argument works for DNF!

- ▶ True for $a, \neg a, \top, \perp$.
- ▶ Let us assume it is true for all formulae φ (up to a certain number of connectives) and call its CNF $\mathit{cnf}(\varphi)$.
 - ▶ $\mathit{cnf}(\neg\varphi) = \mathit{cnf}(\mathit{nnf}(\neg\varphi))$
 - ▶ $\mathit{cnf}(\varphi \wedge \psi) = \mathit{cnf}(\varphi) \wedge \mathit{cnf}(\psi)$
 - ▶ Assume $\mathit{cnf}(\varphi) = \bigwedge_i \chi_i$ and $\mathit{cnf}(\psi) = \bigwedge_j \rho_j$ with χ_i, ρ_j being clauses. Then

$$\begin{aligned} \mathit{cnf}(\varphi \vee \psi) &= \mathit{cnf}\left(\left(\bigwedge_i \chi_i\right) \vee \left(\bigwedge_j \rho_j\right)\right) \\ &= \bigwedge_i \bigwedge_j (\chi_i \vee \rho_j) \quad (\text{by distributivity}) \end{aligned}$$

How to Decide Properties of Formulae

How do we decide whether a formula is satisfiable, unsatisfiable, valid, or falsifiable?

Note: Satisfiability and falsifiability are NP-complete. Validity and unsatisfiability are co-NP-complete.

- ▶ A CNF formula is valid iff all clauses contain two complementary literals or \top .
- ▶ A DNF formula is satisfiable iff one disjunct does not contain \perp or two complementary literals.
- ▶ However, transformation to CNF or DNF may take exponential time (and space!).
- ▶ One can try out all truth assignments.
- ▶ One can test systematically for satisfying truth assignments (backtracking search) \rightsquigarrow **Davis-Putnam procedure (DP)**

Deciding Entailment

- ▶ We want to decide $\Theta \models \varphi$.
- ▶ Use deduction theorem and reduce to validity:

$$\Theta \models \varphi \text{ iff } \bigwedge \Theta \rightarrow \varphi \text{ is valid.}$$

- ▶ Now negate and test for unsatisfiability using DP.
- ▶ Different approach: Try to **derive** φ from Θ – find a **proof** of φ from Θ
- ▶ Use **inference rules** to **derive** new formulae from Θ . Continue to deduce new formulae until φ can be deduced.
- ▶ One particular calculus: **resolution**

Resolution: Representation

- ▶ We assume that all formulae are in CNF.
 - ▶ Can be generated using the described method.
 - ▶ Often formulae are already close to CNF.
 - ▶ There is a “cheap” conversion from arbitrary formulae to CNF that preserves satisfiability – which is enough as we will see.
- ▶ More convenient representation
 - ▶ CNF formula is represented as set.
 - ▶ Each clause is a set of literals.
 - ▶ $(a \vee \neg b) \wedge (\neg a \vee c) \rightsquigarrow \{\{a, \neg b\}, \{\neg a, c\}\}$
- ▶ Empty clause (symbolically \square) and empty set of clauses (symbolically \emptyset) are different!

Resolution: The Inference Rule

Let l be a literal and \bar{l} its complement.

The resolution rule

$$\frac{C_1 \cup \{l\}, C_2 \cup \{\bar{l}\}}{C_1 \cup C_2}$$

$C_1 \cup C_2$ is the **resolvent** of the **parent clauses** $C_1 \cup \{l\}$ and $C_2 \cup \{\bar{l}\}$. l and \bar{l} are the **resolution literals**.

Example: $\{a, b, \neg c\}$ resolves with $\{a, d, c\}$ to $\{a, b, d\}$.

Note: The resolvent is **not** logically equivalent to the set of parent clauses!

Notation:

$$R(\Delta) = \Delta \cup \{C \mid C \text{ is resolvent of two clauses in } \Delta\}$$

Resolution: Derivations

D can be **derived** from Δ by resolution (symbolically $\Delta \vdash D$) if there is a sequence C_1, \dots, C_n of clauses such that

1. $C_n = D$ and
2. $C_i \in R(\Delta \cup \{C_1, \dots, C_{i-1}\})$, for all $i \in \{1, \dots, n\}$.

Define $R^*(\Delta) = \{D \mid \Delta \vdash D\}$.

Theorem (Soundness of resolution)

Let D be a clause. If $\Delta \vdash D$ then $\Delta \models D$.

Proof idea.

Show $\Delta \models D$ if $D \in R(\Delta)$ and use induction on proof length.

Let $C_1 \cup \{l\}$ and $C_2 \cup \{\bar{l}\}$ be the parent clauses of $D = C_1 \cup C_2$.

Assume $I \models \Delta$, we have to show $I \models D$.

Case 1: $I \models l$ then there must be a literal $m \in C_2$ s.t. $I \models m$. This implies $I \models D$.

Case 2: $I \models \bar{l}$ similarly, there is $m \in C_1$ s.t. $I \models m$.

This means that each model I of Δ also satisfies D , i.e., $\Delta \models D$. □

Resolution: Completeness?

Do we have

$$\Delta \models \varphi \text{ implies } \Delta \vdash \varphi?$$

Of course, could only hold for CNF. However:

$$\left\{ \{a, b\}, \{\neg b, c\} \right\} \models \{a, b, c\}$$

$$\left\{ \{a, b\}, \{\neg b, c\} \right\} \not\models \{a, b, c\}$$

However, one can show that resolution is **refutation complete**:

$$\Delta \text{ is unsatisfiable iff } \Delta \vdash \square.$$

Entailment: Reduce to unsatisfiability testing and decide by resolution.

Resolution Strategies

- ▶ Trying out all different resolutions can be very costly,
- ▶ and might not be necessary.
- ▶ There are different **resolution strategies**.
- ▶ Examples:
 - ▶ **Input resolution** ($R_I(\cdot)$): In each resolution step, one of the parent clauses must be a clause of the input set.
 - ▶ **Unit resolution** ($R_U(\cdot)$): In each resolution step, one of the parent clauses must be a unit clause.
 - ▶ Not all strategies are (refutation) completeness preserving. Neither input nor unit resolution is. However, there are others.

Horn Clauses & Resolution

Horn clauses: Clauses with at most one positive literal

Example: $(a \vee \neg b \vee \neg c), (\neg b \vee \neg c)$

Proposition

Unit resolution is refutation complete for Horn clauses.

Proof idea.

Consider $R_U^*(\Delta)$ of Horn clause set Δ . We have to show that if $\square \notin R_U^*(\Delta)$, then $\Delta (\equiv R_U^*(\Delta))$ is satisfiable.

- ▶ Assign *true* to all unit clauses in $R_U^*(\Delta)$.
- ▶ Those clauses that do not contain a literal l such that $\{l\}$ is one of the unit clauses have at least one negative literal.
- ▶ Assign true to these literals.
- ▶ Results in satisfying truth-assignment for $R_U^*(\Delta)$ (and $\Delta \subseteq R_U^*(\Delta)$).

□
