### General procedure for obtaining a heuristic

Solve an easier version of the problem.

#### Two common methods:

- relaxation: consider less constrained version of the problem
- abstraction: consider smaller version of real problem

In previous chapters, we have studied relaxation, which has been very successfully applied to satisficing planning.

Now, we study abstraction, which is one of the most prominent techniques for optimal planning.

## Abstracting a transition system

FREIBU

Abstracting a transition system means dropping some distinctions between states, while preserving the transition behaviour as much as possible.

- An abstraction of a transition system  $\mathscr{T}$  is defined by an abstraction mapping  $\alpha$  that defines which states of  $\mathscr{T}$  should be distinguished and which ones should not.
- From  $\mathscr{T}$  and  $\alpha$ , we compute an abstract transition system  $\mathscr{T}'$  which is similar to  $\mathscr{T}$ , but smaller.
- The abstract goal distances (goal distances in  $\mathcal{T}'$ ) are used as heuristic estimates for goal distances in  $\mathcal{T}$ .

Abstractions: informally

#### Introduction

Practical requirements

abstractions

Abstractions:

# Abstracting a transition system: example

# UNI FREIBURG

### Example (15-puzzle)

A 15-puzzle state is given by a permutation  $\langle b, t_1, \dots, t_{15} \rangle$  of  $\{1, \dots, 16\}$ , where b denotes the blank position and the other components denote the positions of the 15 tiles.

One possible abstraction mapping ignores the precise location of tiles 8–15, i. e., two states are distinguished iff they differ in the position of the blank or one of the tiles 1–7:

$$\alpha(\langle b, t_1, \ldots, t_{15} \rangle) = \langle b, t_1, \ldots, t_7 \rangle$$

The heuristic values for this abstraction correspond to the cost of moving tiles 1–7 to their goal positions.

# Computing the abstract transition system

FREIBUR

Given  $\mathcal{T}$  and  $\alpha$ , how do we compute  $\mathcal{T}'$ ?

### Requirement

We want to obtain an admissible heuristic.

Hence,  $h^*(\alpha(s))$  (in the abstract state space  $\mathscr{T}'$ ) should never overestimate  $h^*(s)$  (in the concrete state space  $\mathscr{T}$ ).

An easy way to achieve this is to ensure that all solutions in  $\mathscr{T}$  also exist in  $\mathscr{T}'$ :

- If s is a goal state in  $\mathcal{T}$ , then  $\alpha(s)$  is a goal state in  $\mathcal{T}'$ .
- If  $\mathscr{T}$  has a transition from s to t, then  $\mathscr{T}'$  has a transition from  $\alpha(s)$  to  $\alpha(t)$ .

Abstractions: informally

# Computing the abstract transition system: example

### Example (15-puzzle)

#### In the running example:

- $\blacksquare$   $\mathscr{T}$  has the unique goal state  $\langle 16, 1, 2, \ldots, 15 \rangle$ .
  - $\rightsquigarrow$   $\mathcal{T}'$  has the unique goal state  $\langle 16, 1, 2, \dots, 7 \rangle$ .
- Let x and y be neighboring positions in the  $4 \times 4$  grid.
  - $\mathscr{T}$  has a transition from  $\langle x, t_1, \dots, t_{i-1}, y, t_{i+1}, \dots, t_{15} \rangle$ to  $(y, t_1, \dots, t_{i-1}, x, t_{i+1}, \dots, t_{15})$  for all  $i \in \{1, \dots, 15\}$ .
  - $\rightarrow$   $\mathcal{I}'$  has a transition from  $\langle x, t_1, \dots, t_{i-1}, y, t_{i+1}, \dots, t_7 \rangle$ 
    - to  $(y, t_1, ..., t_{i-1}, x, t_{i+1}, ..., t_7)$  for all  $i \in \{1, ..., 7\}$ .
  - $\rightsquigarrow$  Moreover,  $\mathcal{T}'$  has a transition from  $\langle x, t_1, \dots, t_7 \rangle$  to  $\langle v, t_1, ..., t_7 \rangle$  if  $v \notin \{t_1, ..., t_7\}$ .

Abstractions:

#### Introduction

formally

# Practical requirements for abstractions

FREE

To be useful in practice, an abstraction heuristic must be efficiently computable. This gives us two requirements for  $\alpha$ :

- For a given state s, the abstract state  $\alpha(s)$  must be efficiently computable.
- For a given abstract state  $\alpha(s)$ , the abstract goal distance  $h^*(\alpha(s))$  must be efficiently computable.

There are different ways of achieving these requirements:

- pattern database heuristics (Culberson & Schaeffer, 1996)
- merge-and-shrink abstractions (Dräger, Finkbeiner & Podelski, 2006)
  - not covered in this course
- structural patterns (Katz & Domshlak, 2008b)
  - not covered in this course

Abstractions:

Introductio

Practical requirements

abstractions

Abstractions

# Practical requirements for abstractions: example

FREIBU

### Example (15-puzzle)

In our running example,  $\alpha$  can be very efficiently computed: just project the given 16-tuple to its first 8 components.

To compute abstract goal distances efficiently during search, most common algorithms precompute all abstract goal distances prior to search by performing a backward breadth-first search from the goal state(s). The distances are then stored in a table (requires about 495 MB of RAM). During search, computing  $h^*(\alpha(s))$  is just a table lookup.

This heuristic is an example of a pattern database heuristic.

Abstractions: informally

Introduction

Practical requirements

Multiple abstraction:

Outlook

Abstractions: formally

# Multiple abstractions

FREIBU

- One important practical question is how to come up with a suitable abstraction mapping  $\alpha$ .
- Indeed, there is usually a huge number of possibilities, and it is important to pick good abstractions (i. e., ones that lead to informative heuristics).
- However, it is generally not necessary to commit to a single abstraction.

Abstractions:

Introduction Practical

Multiple

abstractions

Abstractions formally

# Combining multiple abstractions

FRE =

#### Maximizing several abstractions:

- Each abstraction mapping gives rise to an admissible heuristic.
- By computing the maximum of several admissible heuristics, we obtain another admissible heuristic which dominates the component heuristics.
- Thus, we can always compute several abstractions and maximize over the individual abstract goal distances.

#### Adding several abstractions:

- In some cases, we can even compute the sum of individual estimates and still stay admissible.
- Summation often leads to much higher estimates than maximization, so it is important to understand when it is admissible.

### Reminder from Chapter 2:

### Definition (transition system)

A transition system is a 5-tuple  $\mathcal{T} = \langle S, L, T, s_0, S_{\star} \rangle$  where

- $\blacksquare$  S is a finite set of states,
- L is a finite set of (transition) labels,
- $T \subseteq S \times L \times S$  is the transition relation,
- $s_0 \in S$  is the initial state, and
- $S_{\star} \subseteq S$  is the set of goal states.

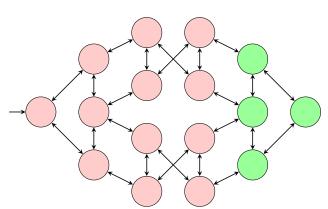

We say that  $\mathscr T$  has the transition  $\langle s,\ell,s'\rangle$  if  $\langle s,\ell,s'\rangle\in \mathcal T$ .

We also write this  $s \xrightarrow{\ell} s'$ , or  $s \rightarrow s'$  when not interested in  $\ell$ .

#### Definition (induced abstractions)

Let  $\mathcal{T} = \langle S, L, T, s_0, S_* \rangle$  be a transition system, and let  $\alpha: S \to S'$  be a surjective function.

The abstraction (of  $\mathcal{T}$ ) induced by  $\alpha$ , in symbols  $\mathcal{T}^{\alpha}$ , is the transition system  $\mathcal{T}^{\alpha} = \langle S', L, T', s'_0, S'_+ \rangle$  defined by:

$$T' = \{ \langle \alpha(s), \ell, \alpha(t) \rangle \mid \langle s, \ell, t \rangle \in T \}$$

$$\blacksquare S'_{\star} = \{\alpha(s) \mid s \in S_{\star}\}$$

Note: It is easy to see that  $\mathcal{T}^{\alpha}$  is an abstraction of  $\mathcal{T}$ . It is the "smallest" abstraction of  $\mathcal{T}$  with abstraction mapping  $\alpha$ .

# Induced abstractions: terminology

FREIBUR

Let  $\mathscr{T}$  and  $\mathscr{T}'$  be transition systems and  $\alpha$  be a function such that  $\mathscr{T}' = \mathscr{T}^{\alpha}$  (i. e.,  $\mathscr{T}'$  is the abstraction of  $\mathscr{T}$  induced by  $\alpha$ ).

- $lacktriangleq \alpha$  is called a strict homomorphism from  $\mathcal{T}$  to  $\mathcal{T}'$ , and  $\mathcal{T}'$  is called a strictly homomorphic abstraction of  $\mathcal{T}$ .
- If  $\alpha$  is bijective, it is called an isomorphism between  $\mathscr{T}$  and  $\mathscr{T}'$ , and the two transition systems are called isomorphic.

heuristics Additivity Refinements

Summary

If we add any goal states or transitions, it is still an abstraction of  $\mathcal{T}$ , but no longer a strictly homomorphic one.

### Definition (abstr. heur. induced by an abstraction)

Let  $\Pi$  be an FDR planning task with state space S, and let  $\mathscr{A}$  be an abstraction of  $\mathscr{T}(\Pi)$  with abstraction mapping  $\alpha$ .

The abstraction heuristic induced by  $\mathscr{A}$  and  $\alpha$ ,  $h^{\mathscr{A},\alpha}$ , is the heuristic function  $h^{\mathscr{A},\alpha}:S\to\mathbb{N}_0\cup\{\infty\}$  which maps each state  $s\in S$  to  $h_{\mathscr{A}}^*(\alpha(s))$  (the goal distance of  $\alpha(s)$  in  $\mathscr{A}$ ).

Note:  $h^{\mathscr{A},\alpha}(s) = \infty$  if no goal state of  $\mathscr{A}$  is reachable from  $\alpha(s)$ 

### Definition (abstr. heur. induced by strict homomorphism)

Let  $\Pi$  be an FDR planning task and  $\alpha$  a strict homomorphism on  $\mathscr{T}(\Pi)$ . The abstraction heuristic induced by  $\alpha$ ,  $h^{\alpha}$ , is the abstraction heuristic induced by  $\mathscr{T}(\Pi)^{\alpha}$  and  $\alpha$ , i. e.,  $h^{\alpha}:=h^{\mathscr{T}(\Pi)^{\alpha},\alpha}$ .

# Consistency of abstraction heuristics

FREIBU

### Theorem (consistency and admissibility of $h^{\mathscr{A},\alpha}$ )

Let  $\Pi$  be an FDR planning task, and let  $\mathscr{A}$  be an abstraction of  $\mathscr{T}(\Pi)$  with abstraction mapping  $\alpha$ . Then  $h^{\mathscr{A},\alpha}$  is safe, goal-aware, admissible and consistent.

#### Proof.

We prove goal-awareness and consistency; the other properties follow from these two.

Let 
$$\mathscr{T} = \mathscr{T}(\Pi) = \langle S, L, T, s_0, S_{\star} \rangle$$
 and  $\mathscr{A} = \langle S', L', T', s'_0, S'_{\star} \rangle$ .

Goal-awareness: We need to show that  $h^{\mathscr{A},\alpha}(s)=0$  for all  $s\in S_{\star}$ , so let  $s\in S_{\star}$ . Then  $\alpha(s)\in S'_{\star}$  by the definition of abstractions and abstraction mappings, and hence  $h^{\mathscr{A},\alpha}(s)=h^*_{\mathscr{A}}(\alpha(s))=0$ .

Abstractions: informally

Abstractions: formally

Transition systems
Abstractions

Abstraction heuristics Additivity

Equivalence Practice

## Consistency of abstraction heuristics (ctd.)

## UNI FREIBUR

#### Proof (ctd.)

Consistency: Let  $s,t \in S$  such that t is a successor of s. We need to prove that  $h^{\mathscr{A},\alpha}(s) \leq h^{\mathscr{A},\alpha}(t) + 1$ .

Since t is a successor of s, there exists an operator o with  $app_o(s) = t$  and hence  $\langle s, o, t \rangle \in T$ .

By the definition of abstractions and abstraction mappings, we get  $\langle \alpha(s), o, \alpha(t) \rangle \in T' \leadsto \alpha(t)$  is a successor of  $\alpha(s)$  in  $\mathscr{A}$ . Therefore,  $h^{\mathscr{A},\alpha}(s) = h_{\mathscr{A}}^*(\alpha(s)) \leq h_{\mathscr{A}}^*(\alpha(t)) + 1 = h^{\mathscr{A},\alpha}(t) + 1$ , where the inequality holds because the shortest path from  $\alpha(s)$  to the goal in  $\mathscr{A}$  cannot be longer than the shortest path from  $\alpha(s)$  to the goal via  $\alpha(t)$ .

#### Definition (orthogonal abstraction mappings)

Let  $\alpha_1$  and  $\alpha_2$  be abstraction mappings on  $\mathcal{T}$ .

We say that  $\alpha_1$  and  $\alpha_2$  are orthogonal if for all transitions  $\langle s, \ell, t \rangle$  of  $\mathscr{T}$ , we have  $\alpha_i(s) = \alpha_i(t)$  for at least one  $i \in \{1, 2\}$ .

## Affecting transition labels

FRE BU

#### Definition (affecting transition labels)

Let  $\mathscr T$  be a transition system, and let  $\ell$  be one of its labels. We say that  $\ell$  affects  $\mathscr T$  if  $\mathscr T$  has a transition  $\langle s,\ell,t\rangle$  with  $s\neq t$ .

#### Theorem (affecting labels vs. orthogonality)

Let  $\mathscr{A}_1$  be an abstraction of  $\mathscr{T}$  with abstraction mapping  $\alpha_1$ . Let  $\mathscr{A}_2$  be an abstraction of  $\mathscr{T}$  with abstraction mapping  $\alpha_2$ . If no label of  $\mathscr{T}$  affects both  $\mathscr{A}_1$  and  $\mathscr{A}_2$ , then  $\alpha_1$  and  $\alpha_2$  are orthogonal.

(Easy proof omitted.)

### Theorem (additivity for orthogonal abstraction mappings)

Let  $h^{\mathscr{A}_1,\alpha_1},\ldots,h^{\mathscr{A}_n,\alpha_n}$  be abstraction heuristics for the same planning task  $\Pi$  such that  $\alpha_i$  and  $\alpha_j$  are orthogonal for all  $i\neq j$ . Then  $\sum_{i=1}^n h^{\mathscr{A}_i,\alpha_i}$  is a safe, goal-aware, admissible and consistent heuristic for  $\Pi$

#### Proof.

We prove goal-awareness and consistency; the other properties follow from these two.

Let 
$$\mathscr{T} = \mathscr{T}(\Pi) = \langle S, L, T, s_0, S_{\star} \rangle$$
.

Goal-awareness: For goal states  $s \in S_{\star}$ ,  $\nabla^n h^{\mathcal{A}_i,\alpha_i}(s) = \nabla^n h^{\mathcal{A}_i,\alpha_i}(s) = \nabla^n h^{\mathcal{A}_i,\alpha_i}(s)$ 

 $\sum_{i=1}^{n} h^{\mathcal{A}_i, \alpha_i}(s) = \sum_{i=1}^{n} 0 = 0$  because all individual abstractions are goal-aware.

## Orthogonality and additivity: proof (ctd.)

# JNI

#### Proof (ctd.)

Consistency: Let  $s, t \in S$  such that t is a successor of s.

Let 
$$L := \sum_{i=1}^n h^{\mathcal{A}_i, \alpha_i}(s)$$
 and  $R := \sum_{i=1}^n h^{\mathcal{A}_i, \alpha_i}(t)$ .

We need to prove that  $L \le R + 1$ .

Since t is a successor of s, there exists an operator o with  $app_o(s) = t$  and hence  $\langle s, o, t \rangle \in T$ .

Because the abstraction mappings are orthogonal,  $\alpha_i(s) \neq \alpha_i(t)$ 

for at most one 
$$i \in \{1, \ldots, n\}$$
.

Case 1: 
$$\alpha_i(s) = \alpha_i(t)$$
 for all  $i \in \{1, ..., n\}$ .  
Then  $L = \sum_{i=1}^n h^{\mathscr{A}_i, \alpha_i}(s)$   

$$= \sum_{i=1}^n h^*_{\mathscr{A}_i}(\alpha_i(s))$$

$$= \sum_{i=1}^n h^*_{\mathscr{A}_i, \alpha_i}(t)$$

$$= R \le R + 1.$$

Abstractions: informally

Abstractions:

Transition systems

Abstraction heuristics

Refinements

Equivalence Practice

## Orthogonality and additivity: proof (ctd.)

#### Proof (ctd.)

Case 2:  $\alpha_i(s) \neq \alpha_i(t)$  for exactly one  $i \in \{1, ..., n\}$ .

Let  $k \in \{1, ..., n\}$  such that  $\alpha_k(s) \neq \alpha_k(t)$ .

Then 
$$L = \sum_{i=1}^{n} h^{\mathcal{A}_i, \alpha_i}(s)$$
  

$$= \sum_{i \in \{1, \dots, n\} \setminus \{k\}} h^*_{\mathcal{A}_i}(\alpha_i(s)) + h^{\mathcal{A}_k, \alpha_k}(s)$$

$$\leq \sum_{i \in \{1, \dots, n\} \setminus \{k\}} h^*_{\mathcal{A}_i}(\alpha_i(t)) + h^{\mathcal{A}_k, \alpha_k}(t) + 1$$

$$= \sum_{i=1}^{n} h^{\mathcal{A}_i, \alpha_i}(t) + 1$$

$$= R + 1.$$

where the inequality holds because  $\alpha_i(s) = \alpha_i(t)$  for all  $i \neq k$  and  $h^{\mathcal{A}_k, \alpha_k}$  is consistent.

#### Abstractions:

Transition systems

Abstractions Abstraction heuristics

#### Refinements

Equivalence Practice

## Abstractions of abstractions: proof (ctd.)

#### Proof (ctd.)

#### 2. For all $s \in S_*$ , we have $\beta(s) \in S''_*$ :

Let  $s \in S_{\star}$ . Because  $\mathscr{T}'$  is an abstraction of  $\mathscr{T}$  with mapping  $\alpha$ , we have  $\alpha(s) \in S'_{\downarrow}$ . Because  $\mathscr{T}''$  is an abstraction of  $\mathscr{T}'$ with mapping  $\alpha'$  and  $\alpha(s) \in S'_+$ , we have  $\alpha'(\alpha(s)) \in S''_+$ . Hence  $\beta(s) = \alpha'(\alpha(s)) \in S''_+$ .

#### Strict homomorphism if $\alpha$ and $\alpha'$ strict homomorphisms:

Let  $s'' \in S''$ . Because  $\alpha'$  is a strict homomorphism, there exists a state  $s' \in S'_+$  such that  $\alpha'(s') = s''$ . Because  $\alpha$  is a strict homomorphism, there exists a state  $s \in S_+$  such that  $\alpha(s) = s'$ . Thus  $s'' = \alpha'(\alpha(s)) = \beta(s)$  for some  $s \in S_{\star}$ .

Abstractions: informally

Abstractions:

Refinements

## FREB

#### Proof (ctd.)

3. For all  $\langle s, \ell, t \rangle \in T$ , we have  $\langle \beta(s), \ell, \beta(t) \rangle \in T''$ 

Let  $\langle s,\ell,t\rangle\in T$ . Because  $\mathscr{T}'$  is an abstraction of  $\mathscr{T}$  with mapping  $\alpha$ , we have  $\langle \alpha(s),\ell,\alpha(t)\rangle\in T'$ . Because  $\mathscr{T}''$  is an abstraction of  $\mathscr{T}'$  with mapping  $\alpha'$  and  $\langle \alpha(s),\ell,\alpha(t)\rangle\in T'$ , we have  $\langle \alpha'(\alpha(s)),\ell,\alpha'(\alpha(t))\rangle\in T''$ .

Hence  $\langle \beta(s), \ell, \beta(t) \rangle = \langle \alpha'(\alpha(s)), \ell, \alpha'(\alpha(t)) \rangle \in T''$ .

#### Strict homomorphism if $\alpha$ and $\alpha'$ strict homomorphisms:

Let  $\langle s'',\ell,t''\rangle\in T''$ . Because  $\alpha'$  is a strict homomorphism, there exists a transition  $\langle s',\ell,t'\rangle\in T'$  such that  $\alpha'(s')=s''$  and  $\alpha'(t')=t''$ . Because  $\alpha$  is a strict homomorphism, there exists a transition  $\langle s,\ell,t\rangle\in T$  such that  $\alpha(s)=s'$  and  $\alpha(t)=t'$ . Thus  $\langle s'',\ell,t''\rangle=\langle \alpha'(\alpha(s)),\ell,\alpha'(\alpha(t))\rangle=\langle \beta(s),\ell,\beta(t)\rangle$  for some

## Heuristic quality of refinements

## FREIBU

#### Theorem (heuristic quality of refinements)

Let  $h^{\mathscr{A},\alpha}$  and  $h^{\mathscr{B},\beta}$  be abstraction heuristics for the same planning task  $\Pi$  such that  $\langle \mathscr{A},\alpha \rangle$  is a refinement of  $\langle \mathscr{B},\beta \rangle$ . Then  $h^{\mathscr{A},\alpha}$  dominates  $h^{\mathscr{B},\beta}$ .

In other words,  $h^{\mathscr{A},\alpha}(s) \geq h^{\mathscr{B},\beta}(s)$  for all states s of  $\Pi$ .

#### Proof.

Since  $\langle \mathscr{A}, \alpha \rangle$  is a refinement of  $\langle \mathscr{B}, \beta \rangle$ , there exists a mapping  $\alpha'$  such that  $\beta = \alpha' \circ \alpha$  and  $\mathscr{B}$  is an abstraction of  $\mathscr{A}$  with abstraction mapping  $\alpha'$ .

For any state s of  $\Pi$ , we get  $h^{\mathscr{B},\beta}(s) = h_{\mathscr{B}}^*(\beta(s)) = h_{\mathscr{B}}^*(\alpha'(\alpha(s))) = h^{\mathscr{B},\alpha'}(\alpha(s)) \leq h_{\mathscr{A}}^*(\alpha(s)) = h^{\mathscr{A},\alpha}(s)$ , where the inequality holds because  $h^{\mathscr{B},\alpha'}$  is an admissible heuristic in the transition system  $\mathscr{A}$ .

Refinements

Equivalence Practice

## Graph-equivalent transition systems

# FREIBUR

#### Definition (graph-equivalent transition systems)

Let  $\mathscr{T} = \langle S, L, T, s_0, S_{\star} \rangle$  and  $\mathscr{T}' = \langle S', L', T', s'_0, S'_{\star} \rangle$  be transition systems.

We say that  $\mathscr{T}$  is graph-equivalent to  $\mathscr{T}'$ , in symbols  $\mathscr{T} \stackrel{\mathsf{G}}{\sim} \mathscr{T}'$ , if there exists a bijective function  $\varphi : S \to S'$  such that:

- lacksquare  $s\in S_{\star}$  iff  $arphi(s)\in S_{\star}'$ , and
- $\langle s, \ell, t \rangle \in T$  for some  $\ell \in L$  iff  $\langle \phi(s), \ell', \phi(t) \rangle \in T'$  for some  $\ell' \in L'$ .

Note: There is no requirement that the labels of  $\mathscr{T}$  and  $\mathscr{T}'$  correspond in any way. For example, it is permitted that all transitions of  $\mathscr{T}$  have different labels and all transitions of  $\mathscr{T}'$  have the same label.

C.....

## Isomorphism vs. graph equivalence

- $\blacksquare$  ( $\sim$ ) and ( $\stackrel{\mathsf{G}}{\sim}$ ) are equivalence relations.
- Two isomorphic transition systems are interchangeable for all practical intents and purposes.
- Two graph-equivalent transition systems are interchangeable for most intents and purposes. In particular, their state distances are identical, so they define the same abstraction heuristic for corresponding abstraction functions.
- Isomorphism implies graph equivalence, but not vice versa.

Abstraction heuristics for planning: main research problem

Automatically derive effective abstraction heuristics for planning tasks.

we will study one state-of-the-art approach in the next chapter.

Abstractions: informally

Abstractions:

formally
Transition systems
Abstractions

Abstraction heuristics Additivity

Refinements

Equivalence

Practice

- An abstraction relates a transition system  $\mathscr{T}$  (e. g. of a planning task) to another (usually smaller) transition system  $\mathscr{T}'$  via an abstraction mapping  $\alpha$ .
- Abstraction preserves all important aspects of  $\mathcal{T}$ : initial state, goal states and (labeled) transitions.
- Hence, they can be used to define heuristics for the original system  $\mathcal{T}$ : estimate the goal distance of s in  $\mathcal{T}$  by the optimal goal distance of  $\alpha(s)$  in  $\mathcal{T}'$ .
- Such abstraction heuristics are safe, goal-aware, admissible and consistent.

- Strictly homomorphic abstractions are desirable as they do not include "unnecessary" abstract goal states or transitions (which could lower heuristic values).
- $\blacksquare$  Any surjection from the states of  $\mathscr T$  to any set induces a strictly homomorphic abstraction in a natural way.
- Multiple abstraction heuristics can be added without losing properties like admissibility if the underlying abstraction mappings are orthogonal.
- One sufficient condition for orthogonality is that abstractions are affected by disjoint sets of labels.

- The process of abstraction is transitive: an abstraction can be abstracted further to yield another abstraction.
- Based on this notion, we can define abstractions that are coarsenings or refinements of others.
- A refinement can never lead to a worse heuristic.
- Practically useful abstractions are those which give informative heuristics, yet have a small representation.
